THE PAY ROCK.—The working force of the Pay Rock M. Co. has been increased of late, there being now 64 lessees and 18 contractors employed. The monthly output has been increased steadily, though the effects of the work of the new men is not yet felt, as they all commenced in ground where there was no ore in sight, and the prospect now is that the yield of the mine will be increased considerably more than at present before next spring. The royalties of the lessees range from 20 to 35 per cent. Fourteen men are at work on the lowest level, 90 ft below the Silver Bank tunnel, drifting, stoping and cross cutting, and taking out good ore. The general appearance of the mine is excellent.

IDAHO.

COLUMBIA.—Wood River *Miner*, Nov. 26: The Columbia mill, at Sawtooth, is now completed all but putting up a few pieces of machinery. It is the equal of the Custer mill in the Yankee Fork district. It was constructed by the same firm, is the exact size of the Custer and has later improvements. The company will keep a force in the mines increasing their ore dumps.

THE Carrie Leonard mine, on Little Smokey, has been proven during the past summer to be very valuable property. Sufficient ore was shipped this year to pay all expense of development and dividends besides. There are now between 30 and 40 tons on the dump.

THE Pilgrim mine at Sawtooth is showing up its treasures to better advantage with every blast. Over 500 tons are on the dump and this will be more than doubled by spring. A force of 10 or 15 men will be employed in this mine during the winter.

NATIVE SILVER IN THE EUREKA.—Wood River *Times*, Nov. 26: A few weeks ago the *Times* stated that for the first time in the history of mining, chunks of native silver had been found in galena, at the Mayflower and Jay Gould mines. Now comes H. Stevenson, general accountant for all the leading bullion mines, who shows chunks of native and wire silver as big as one's fist, which were extracted from a recent find in the Eureka. This new strike was made on the tunnel lovel, about 115 ft from the face, last Monday afternoon.

BAY HORSE.—Salt Lake *Tribune*, Nov. 27: A gentleman just returned from Bay Horse, Idaho, informs us that the mines in that camp are developing far beyond the predictions of the most sanguine. This gentlemen declares the belief that the Bay Horse camp has yielded more bullion and more high-grade ore this season than any camp in Idaho. The Ram's Horn mine continues to be the king of the camp, and presents a wonderful record. Though never worked to its full capacity, it has produced 300,000 ozs. of silver, and has now on its dump and in sight in the mine, ore to make more bullion than has ever been taken out. All the way down the mine looks superbly, and in the lowest openings a splendid body of ore filled with native silver has been exposed. The Bay Horse people are most sanguine of the wealth of their camp.

MONTANA.

PHILLIPSBURG MINES.—*New Northwest*, Nov. 25: As the result of my customery weekly visit to the mines in the line of this district, I find that all of them, presently under development, show marked improvement. The new body of ore uncovered in the level west of the 400-ft cross cut in the lowest workings of the Algonquin mine continues the same, in width and value, as the header advances west. The grade of rock extracted is exactly the same in quality and appearance as that of first-class Trout, and judging from present indications the supply will soon be equal to all demands of the mill. The new holst over the Ememld mine is et last completed and under the careful supervision of Asst. Supt. Harvey Showers, this valuable property is fast assuming shape and form. The ore from the 50-ft level will average 50 ozs. throughout, while the output per day, after the mill starts up, will not exceed 25 tons of working ore. Sinking the Trout shaft is being pushed ahead with all dispatch. The shaft is now down 570 ft with 30 more to run before starting the new level. The Hope mine is a steady producer and the mill is kept at work on 50 oz. ore. A tunnel has been started on the south side of the mine to tap it below its lowest workings. The completion of this adit will greatly facilitate the extraction and handling of ores found at its introduction of the vein. The tunnel on the Orphan Boy is in 45 ft with 20 more to go. Messrs. Patton & Co. have e large quantity of surface ore in sight on the line of the vein above, and will certainly open out a mine when the foot wall is reached. The snow in the Granite has increased so in depth that the development of last summer discoveries must of necessity be laid over until spring. Then roads will be constructed to the principal mines, which will allow them to be worked at ell seasons.

NEW MEXICO.

CARBONATEVILLE.—Cor. Los Vegas *Mining World*, Nov. 15: At no time since the organization of this camp has there been so great an amount of work going on, and of such magnitude, as at present, while the camp is kept red hot with excitement over new and rich strikes that are being made nearly every day. A strike of rich ore in the Marshall Bonanza, varying in thickness from 2 to 4 ft, has been made, and large quantities of this fine mineral is now being taken out and shipped to St. Louis for treatment. Mayor Sisson of Valleceitas reports a 3-ft strike in his Georgia, of carbonates, which are pronounced away up by experts from Colorado. In the Capital and Bonanza No. 3 very rich strikes of large dimensions have been made. Also in the Bodine Dollar or Old Santa Rosa. In this property the vein is 7 ft in width, and from wall to wall is a mess of galena running in coursee of from 7 to 18 inches in thickness. On the Nick of Time, 2 shefts are to be commenced at once and continue sinking until water is reached. A level will be run and machiuery planted. This property has been placed in the hands of a company of Davenport, Iowa, capitalists, backed by $20,000,000, who propose to make things hum. Three thousand dollar ore is now being taken from the Cnsh Entry, and the proprietor justly feels elated over the rich prospects in store for him. Machinery is now on the ground for Bonanza No. 3 and is being p aced in position, when ore will be taken from this shalt which will astonish the natives. The Duryee smelter is a fraud nnd compares with a smelter about as much as it does with a gristmill, and nay attempt to plant one in the Territory should be met with contempt. At Las Cerrillos the smelter will soon be in operation and ready to receive ore. They complain that a sufficient quentity of ore cannot be had. Let them commence work and they will find more ore thau they can handle with their present capacity will be produced on short notice. The largest nssay yet obteined in this district is from the Mexican Prince, containing free gold and is $155,240 36. This is way up, and shows that, though it may he very high, ore enough can be obteined to pay for working and leave a handsome profit.

OREGON.

WINTER.—*Democratic Times*, Nov. 25: The prevailing cold snap has put an end to mining operations for the present. Piping has been suspended at the Sterling mine, water having become scarce again. A great deal of mining will be done this winter, should there be an abundance of water. Miners in Josephine county, as well as in this, are busily engaged in preparing for the winter campaign. Jesse Dodge, of Willow Springs precinct, will try his luck in some diggings near his residence this winter. J. H. Williams, lately of Sterlingville, has moved to Farmer's flat, where he will look after August Wulf's mining interests. T. H. Fielder & Sons, of Evans creek, have purchased mining ground of J. M. Kendrick, on Jackson creek, and will take possession at once. W. A. Johnson, the well-known quartz miner, is still engaged in going down on the Jewett ledge. He crushed a few tons of quartz recently with an arastra, which yielded rather favorably. R. M. Caine, who has been employed on the Squaw Lake Co's mines on Big Applegate, came to town Wednesday. From him we learn that water has been turned into the ditch, but that no work is being done as yet, owing to the extremely cold weather. W. H. Benner, of the Centennial mine, in Willow Springs precinct, informs us that everything is in readiness there for winter, and that one day's piping was done before the cold snap interfered. He says it is doubtful whether the mines in Dodge's field will be operated extensively this winter.

UTAH.

NOTES.—Silver Reef *Miner*, Nov. 10: A visit to the mines by our reporter found the usual activity all along the line. At no time during the history of the camp has the business shown to better advantage than now. Both mines and mills are showing well, under thorough and systematic management.

THE STORMONT CO.—As the fourth south level from the Savage shaft has advanced the ore has improved very considerably, and now shows a paying 4-ft vein of characteristic Buckeye ore in the face. This is considered of more than ordinary importance, from the fact that the same character of ore was encountered above, and in each of which the grade improved with depth.

THE CHRISTY CO.—In the California the ore bodies are all showing well, especially in the third nnd fourth levels north, in which splendid developments have recently been made. At the Maggie nnd Silver Flat work continues with the usual flattering results. Taking the company's property all in all, it never looked or yielded better than at present.

THE BARBEE AND WALKER.—The late strike of ore in the winze driven from the fourth north level has steadily improved, and is yielding handsomely. The main incline is being driven down with 8-hour shifts, and will be sunk 100 ft from the present station. The mine throughout is looking well.

THE LEEDS.—The ore from the Bonanza shaft is proving of much better grade than that previously taken from the east incline, and will help to increase the mill product very considerably.

THE GOLD BASIN MILL.—The experimental ten days' run of Messrs. Davis, Ridenour & Co.'s 5-stamp mill at Gold Basin cleaned up $2,052 94 from 60 tons of ore from the Patterson mine. Everything is reported running smoothly, and a continuous product may be looked for from this source in future.

A. S. BIGELOW, of Columbia Hill, Has been appointed superintendent of the Eureka Lake and Yuba Canal Co.'s properties in Nevada county, to succeed Robt. McMurray, the former efficient manager, who recently resigned.

The Upper Kern—The Kaweah Group.

[Written for the PRESS by J. W. A. WRIGHT.]

The sketcb accompanying your late engraving of "Mt. Whitney as seen from Mt. Young" baving been writtsn in our rough and exposed monntain camp in Whitney canyon, nsar ths western base of our great mountain, was nscessarily condsnsed. As it was not certain that the engraving could he msde, no explanation was given ahout the Mt. Young, from whicb the view was taken, and other points requircd to properly understand it. Witb your consnt euch explanation will now be given, togetber with other facts collected by our exploring expedition during the three weeks we spent in the almost unknown and very elevated and curious regions of the Upper Kern, its varions tributaries, and its numerous lofty and precipitous divides. Some iteme will also he recorded ahout the grand Kaweah Buttes and the ascent, perhaps for the first time, of

Mt. Kaweah,

The taking of its altitude and the approximate hights of adjacent and previously unnamed peaks in the same unexplored group. Our thanks are due the proprietore of the PRESS for the engraving prepared to accompany this sketch, and accurately representing Mts. Kaweah, Henry and Ahert, as seen from our camp some four milee south from the summit of the former and at an elevation ahove sea level of about 10,400 ft. This and the engraving of Mt. Whitney were both from pencil drawings made under great disadvantagss by the Rev. F. H. Walee, of Tulare City, who was one of our party of three. Thougb plain, they have the merit of giving accurately, for the first time, the appearance of these noted mountains from the nearest and best points of view accessihle. Now, wbere ie Mt. Young, from wbose summit the view of Mt. Whitney was taken? The only route hy which Mt. Whitney is at present accessihle for pack animale ie hy the regular trail from the southwest. This first reaches

Whitney Creek,

In a large *cienega*, or marshy meadow, at least five miles southwest of the eummit of Mt. Whitney, and here the first view of the mountain is obtained hy tbis route. You follow up the creek througb its deep canyon, tbe heavily timbered ridges, and afterwards tbe bare gray granite ridges, rapidly rising higber and bigher on each side, until, a mile or two heyond, yon pass tne lower of four small clear lakes and come to a grassy meadow, witb a half dozen large tamaracks or backmatacks at the point of entrance. Here, as tbe short, "cnrly" grass peculiar to our Alpine meadows was abundant, and there was plenty of wood, we had our camp from Septemher 3d to 8th. The view of this part of the canyon, looking eastward, is exceedingly picturesque and grand, closed entirely at its upper end, as it is, by the bare, craggy precipices of Whitney's immense granite masses, two miles distant, perhaps, in a straight linc. On eacb side of the entrance of tbis rockiest, wildest, and most glacier-worn part of the canyon, is a long, hare granite ridge, each terminating in a high isolated peak. At the suggestion of Mr. Wales, our party agreed to name the one on the soutb side

Mt. Hitchcock,

In bonor of Prof. Charles Hitcbcock, the well-known geologist of Dartmouth, where Mr. Wales spsnt bis college days, and that on the north Mt. Young, after our distinguished astronomer, formerly of Dartmouth, now of Princeton. The day before we left camp Whitney, to pursue our almost trackless route to the sources of the main Kern, Mr. Wales, witb our instruments, made the ascent of Mt. Young, found its altitude to he approximately 13,600 ft., huilt a monument five ft. high, and left in it the record of the naming of tbe two mountains. At 1:30 P. M., be found the temperature was 48° in shade, and 66° in sun; and our aneroid read 18.60. We may as well record in this connection, that the day before (Sept. 6th), at 12:45 P. M., on the summit of Mt. Whitney, the eame instruments indicated as follows: Barometer, 17.60; tbermometer 42° in sbade. Also, in our camp Whitney at midnight, Sept. 7th, our harometer stood 20.30, and thermometer 38°. The water of Whitney creek, clear and pure as csn be, varied in temperature at night from 36° to 40°, and some mornings thin ics was formed alongits edges. Between 1 and 2 P. M., Sept. 7th, its water was 46°, with the atmosphere at 60°, and your correspondent enjoyed the luxury of an air bath and

A Plunge Bath

In that calm, sunny atmosphere, and in the rushing waters of that icy mountain stream. If any of yonr rsaders don't think that watcr felt cold enough for this to be fairly termsd an Arctic hath, or don't hslieve that our party found considerahle gennine "red snow" at several points, from 10,500 to 12,500 ft. in altitude, I only wish I had had him there to "dnck" him. That is all. He would prohably have heen convinced then.

This heautiful stream that is fed by the psrsnnial smow mssses and lakes along Mt. Whitney's western, northwestern and southern slopss, ran —from 10 to 15 ft. wide, and 2 to 3 ft. deep—within 20 steps of our picturesqne camp, and, rushing in many a rapid and cascade in a southwesterly course, empties into the main Kern, not very far above where the "Fourth Standard Line South" intersects it—possibly two or three miles. In this and other etreams, at great altitudes, we not only

Found no Fish,

But the only living things we saw in them and the higher lakes were frogs, tad-poles and the uhiquitous and curious water insect called the *Notonecta* or "water-hoatman."

This insect, a spscies of water heetle, is really amphihious. Hence, no doubt, ite ahility to reach these high altitudes. It is the insect which, while in the water, ewims on its hack, and from this gets its syetematic name, *notonecta*, meaning literally hack-swimmer. By means of a buhhle of air, whicb nature enables it to form, it frequently rises to the surface, thence quickly darts to the hottom again, using its feather-like legs for oars. Take it from the water and dry it in the sun, and it soon epreade its wings like any beetle and flies away, generally to the water. Handle it with great care, if at all, for tbougb it bas no eting, it has a sharp peak or snout with wbich it can easily pierce the hand. Thie it is sure to do, if you give it a fair chance, and you will imagine youreelf etung. In fact, you migbt as well he. Yet the puncture ie not poisonous. I bere describe this insect that your readers may recognizs it, and may at some time examine it, for it ahounds in our springs, streams and ponds, at almost all altitudes, as our late mountain trip proved. Strange ae it may seem, tbis is one of the many insects wbicb in San Joaquin valley and otber parts of California, flits around our lamps and candles on summer eveninge, leaving its watery home for its excursions hy nigbt. In future, I shall hope to record in your columns more ahout

The Animal and Vegetable Forms

Fonnd in the bigb Sierras of Tulare county. We have specimene of all tbe higher flora of tbese regione for fnture use. Of all insects found in our alpine regione the most interesting and nseful is the "ealmon fly" and its larva. It helongs to the kingdom of tbe dragon fly. Its grnb and the perfect fly are the very best bait for the "golden trout." In July and Angust these grubs are found nnder and adhering to rocks and logs, in the edges of streams and lakes, or crawling on the hottom in shallow water and dragging witb them their long, flat, sand-covered cases or cocoons. During the first two weeks in September the gruhs are transformed to tbe perfect insect. While we were camped on tbe main Kern, at altitudes between 8,000 and 9,000 ft., tbese "ealmon flies" darted around our camp fires at night in large nnmhers, and we found them and "hlue-tail flies" about as good trout bait as tbeir larvæ or grubs. Wherever trout abound these do. We found them in streams at bights of 10,500 ft., the highest points wbere we caugbt

The Golden Trout

Being abont 9,500 ft. in altitude. It is to be hoped that all these higher streams and lakes above falls and cascades impassable for fish will some day he stocked with these splendid trout, just as the two "Monarcb lakes" in Monarch canyon, of tbe Mineral King district, have heen stocked tbis summer by private enterprise. Tbe altitude of Lower Monarcb lake is 10,500 ft.; the upper one, 10,800 ft. On the 21st of September tbe 200 trout put in tbsm about a month hefore by Messrs. Lavells, Ward and Wren were doing well.

Befors we tske your readsrs to Mt. Kaweah, we must tell of two more conspicuous mountains to which our exploring party gave names, hsfore ws reached Whitney canyon. The night hefore our arrival there we camped ahout 10-, 500 ft. ahove ssa level, in Loomis' canyon on Loomis' creek, so named from ons of the first men who took sheep that bigh up in these mountains. Meeting there Mr. D. Durward, of Kern county, with his sheep, we eoon learned that we were surrounded by bold mountain peaks, nameless and hut little known. Next morning after a tedious and difficult ascent of some 1,500 ft. in a distance of ahout two miles, we found ourselvee in a high, well wooded pass at an elevation of nearly 12,000 ft., witb a commanding view in every direction. West of us wae a bare pyramidal granite peak, and to the eastward a long higb ridge and peak. By my special request these were named.

Mts. Guyot and Agassiz,

Mt. Guyot to the westward. We also called this gap Guyot pass, in honor of our emiuent geographer and geologist, whose instructive lecturee at Princeton, New Jersey, will ever bs among my pleasantest recollections of early life. We all thought it suitable that the honored names of Agassiz and Guyot, who were hosom friends at Neufchatel and elsewhere in Switzerland, should he closely associated among our higher Sierras, as they have so long been in the achievements of modern ecience. Mr. Wm. B. Wallace, our guide and friend, and an expert in mountain climhing, made the ascent of Mt. Guyot for me, took its bight, erected a monument, and left a record of tbe new names. At noon the temperature on tbe summit was, in the shade, 43°, in the sun, 49°, and the altitude about 13,500 ft. There were large snow patches (Septemher 3d) on the north and east slope of Mt. Guyot and on the western slope of Mt. Agassiz. During the ascent Mr. Wallace saw msny traces of the

Big Horn, or Mountain Sheep,

And we fonnd them afterwards on other higb points, including Miner's peak, near Mineral King, but never once could we get a sight of these shy and cnnning denizens of our bighest mountains. It may be well to mention here that Mr. Wales found some red snow on one of the ridges of Mt. Young. He learned also, from conversation witb an Indian from Lone Pine, who was in Capt. Michaelie' camp, that he had found red snow while coming np Lone Pine canyon to Mt. Whitney. Our party afterwarde found it in large quantities at a hight of 12,000 ft., near the head of Jenny Lind canyon, just north of the Kaweab group of peaks.

But how did we reacb

Mt. Kaweah,

And succeed in making tbe ascent, which has long been deemed so difficult, and hy some, almost impossihle? From Camp Whitney we traveled with our seven animals—two of them well packed—for at least 30 miles before we hegan to ascend towards tbe vast and heavily timbered table-land from which the Kaweab group of mountains rises like so many isolated buttes. To hs hrief, onr stages were ae follows, over the rongheet route imaginable, and without any trail at all most of the distance: To Moraine camp seven miles, general direction northweet, elevation 11,400 ft., crossed large eastern brancb of Kern river, whicb we call Moraine creek; altitude of the ford 10,800 ft. To Milestone camp, just east of Milestone mountain, five miles, altitude 11,400 ft. This was about three miles helow the extreme sourcee of the main Kern; crossed another large eastern hranch of the Kern, at hight of 11,200 ft., call it Tyndall creek. This was our farthest point north, and was near the base of the precipitous divide bstween Kern and Kings river. From tbis camp Mr. Wales ascended tbe divide and made an ohservation of the upper Kings rivsr region. Thence we went due soutb down the

Canyon of the Main Kern

To Junction camp eight miles, altituds 8,400 ft.; thencs south to Fern camp, just above ths junction of Crabtres creek with the main Kern, 10 miles, altitude about 6,800 ft. At Milsstons camp and as we passed down ths upper part of Kern canyon—one of the deepsst, longest, and grandest gorges of the Sierra Nsvada—we had a fine view of Mt. Guyot, which was nearly due eonth of us, and is a very prominent landmark for all that region. Up to this point we had heen eo fortunate as to find grass enough at each camping spot for our faithful animals. At the latter camp, however, in a dense forest, the only one we ventured to reach after dark, there was nothing hut ferns in the way of horse fesd, and of these they eat sparingly as you may snppose. The thought often occurred to us, on this long muscle-testing and lung-testing mountain journey, when our horses, panting and jaded, had at different times taken us to hights of 10,000, 11,000, 12,000 and even 12,500 ft., tbat the faithful hrutes were as near horse-heaven as they would ever he; hut you may rest assured, after that night'e experience on ferns, they looked next morning a good deal as if they thought they had heen in

The Infernal Regions.

When informed that in the next 10 miles from Fern camp to the eummit of Mt. Kaweah we had to climh at least 7,200 ft. in altitude, you can understand that it was one of the toughest and moet trying parts of our mountain experience, and that we found it necsssary to travel hut a ehort distance eacb day.

MTS. KAWEAH, HENRY AND ABERT LOOKING NORTHWARD FROM HIGH TABLE LAND.

Sept. 14th, we went northweet and ascended a very steep trail 1,800 ft. to Island camp, a pretty grassy spot, on tbe lower one of four small streams, which, dashing over the very high, perpendicular western wall of Kern canyon, form some of the bighest, if not the very highest waterfalls in California, or, indeed, in the world. Having an opportunity to take the altitude of the fall from this first stream, hy baving our aneroid at tbe hase and afterwards at the point where the wild watsre leap over the bluff into the canyons, we found it was 1,500 ft. The bighest fall, eome distance ahove this, whicb we named, at Mr. Wallace'e euggestion

Sha-goo-nah Falls,

From the Indian name of Mount Williamson, must be in its entire descent, at least 3,000 ft. high. Even so late ae Septemher 13th, it was a grand and heautiful waterfall, and the towering cliffs on each side of it were very much like El Capitan, in Yosemite valley. By a ride of three miles September 15th, we ascended 1,800 ft. more, and camped at the point from which the

View of Mt. Kaweah

Here given, was sketched by Mr. Wa'es. Hsre we pitched our tent, for tbe second time on the trip, and called it Camp Kaweah, altitude, 10,400 ft. There ie hut one route known or prohahle for a pack train over the great western wall of Kern canyon to thie point, and but one westward to the deep and picturesqne gorge known as Jenny Lind canyon, through which runs Crahtree creek, the chief western tributary of the Main Kern, nortb of the Little Kern river. Tbese passee lie near tbe fourth standard line south of the United States Surveys, the only Governmsnt line that bas ever yet heen surveyed througb that country, and it runs only to the western verge of Ksrn canyon. Our camp, in the edge of a tamarack or backmatack forest, just soutb of Mt. Kaweah, was near this line.

At 9 A. M., September 16th, after a solid monntain breakfast, onr party etarted, well mounted, provided with onr instruments, lunch and a canteen of water,

The Ascent of Mt. Kaweah

By a route we had partly traced tbe afternoon hefore. The temperature at 10 P. M. the 15th was 34°; at 6:30 A. M. the 16th was 38°, whils the water in the purling, limped hrook ncar our camp was 43° By noon we had passed through the dense forest that skirts all the southern hase of tbis grand old mountain to an altitude of nearly 12,000 ft., had ridden over the rocky debris up, up, up above the last etunted *pinus contorta*, and tethered our horses to the rocks in what we called "Quartz Nich," hecanse of quantities of glassy, harren quartz found there, some of it smoky quartz. The elevation bere was 12,500 ft., tbe highest point to wbich we rode our horses at any time on the excursion. As there was a southern exposnre, the temperature was very pleasant—72° in the shade. At 3 P. M., after climhing over at least a mile of the roughest rocks, the top of the lowest peak was reached. Its hight was found to be not far from 13,550 ft. Temperatnre in

sbade, 60°. Between this and ths highest poiut a peculiar snow patch was fonnd like ono near ths summit of Mt. Whitney. Wo could think of no morc descriptive nams for it thsn

Serrated Snow.

Thc plsces named are ths only two whero we ever saw anything like it. It is similar to soms of tbe npper surfaces of tbe glacial forniations of ths Alps, as repressuted by engraviugs. Tho whole surfacs, of the most dazzling whitencss, stands up in small cones from threc to six ft. high, like miniaturs Sierra. Unlike other snow, it had ths appearancs of hnge skeins of satin floss drawn to a point. Yet thoro was no otber semblance to a glacial formation, nor did we discover auything like a living glacier on this journey of fully 200 miles in our highest and most unfrequented Sierra, and in some of their most insccessibls gorges, vast fields of granite, thoroughly polished by glacial action in tbs remots past, wsre found in Whitney canyon, at the head of Jenny Lind canyon, just north of Mt. Abert, and afterwards at the bsad of Monarcb cânyon, in the Mineral King district, on ths southern elops of Miner'e peak.

At 4:40 P. M., our party had the satisfaction to bs united

On the Summit of Mt. Kaweah.

We found not ths slightest evidencs that any human being bad ever been there before us. Friends Wallace and Wales built a neat monument about four ft. high, and in a small tin case we left a record of the ascent. Our barometsr stood at 18.225 or about 800 ft. less than it indicated on ths summit of Whitney. Hsnce, to call the altitude 14,000 ft. cannot bs far wrong, yet 14,200 ft. may not be too much. The high reddish cons in tbe group about two miles northwest of Mt. Kaweah we found by carsful levcling is perhaps 100 ft. higher than Kawsah itself. We named it in honor of Prof. Joseph Henry, eo long in cbarge of the Smithsonian Institute. The similar dark peak about a mils farther northwsst, and tbs extrems northern peak of the Kaweah group, wo named for Col. J. J. Abert, who, as one of the earliest graduates of West Point, was for mors tban 30 years cbief of ths Topographical Engineers U. S. A., and under whose direction Fremont made his first noted expeditiou to this coast. We bops

Mts. Henry and Abert.

Will be permansntly known by tbese worthy names. Mt. Abert is sligbtly lower than Kaweah; perbaps 50 or 100 ft. From the Tulare and Fresno county plains tbese are the tbree highest, barest points seen in the clear days of winter; Mt. Abert the cone farthest nortb, Mt. Henry, tbe cone next to the south, and Mt. Kaweab, tbe long doms just south of tbem. The perspective in tbe accompanying engraving from a point nearly 4,000 ft. below tbeir summits, makee Mt. Abert, to tbs left, and Mt. Henry, in tbe middle, look much lower tban Kaweah's great mass, which is nearest to tho point of view. But a sids viaw from sast or west makes the tbree appear of about ths same bigbt.

Want of space forbids an attempt to dsscribe tbe magnificent array of our bighest mountains that surround Mt. Kaweah's grand old doms. The latter is about the center of a great circle of ridges and peaks, whose radius is about 10 miles. About a dozen line lakes were in sigbt, one of which, a mile south of our camp, and formerly visited by Mr. Wallace, covers at least 160 acres.

We will closs this sketch with tbe meaning of the Indian name Kaweah, which I bad the pleasure to learn from Mr. Joe Palmer, a noted mountaineer. Tho true word is Kah-wab, accented on the last syllable. Its literal meaning is "I sit bere," or, more freely rendered, "Here I rest" or "Here I dwell."

New Mines.—We learn from Cerro Gordo thst John H. Ely and party have returned from tbsir prospecting trip, bringing with tbem a large number of samples of very rich silver ores. The new district is said to he about 80 miles east of Cerro Gordo. Mr. Ely claims that thers are millions of ore lying around loose, of the ssme quality as the ssmples brought in. A team can be driven on to the mines, water is plenty, but wood is ratber scarce. Tbs orss are mostly rich chlorides and born silver. A number of samples bave been forwarded to the Independence assay office, and in appearance, some of them would certainly deceive the oldest rock sharp in the country. Two of them in particular closely resemble a soft, grsyisb limsstone, that if not found in a mineral vein, a prospector would not notics. These two samples assay $416.12 and $475.25 per ton in silver. Four other samples aesay respectively $1,112.42, $927.64, $682.56 and $128 silver. The discoverers will proceed at once to organize a district and prospect their claims.—*Inyo Independent.*

Illustrating Mines.—At a meeting of tbe Engineers' Club in Philadelpbia the other day, Chas. A. Asbburner exhibited and dscribed two maps of tbat part of tbe coal rgions of Pennsylvania from Mabsnoy City to Shenandoak. Ons was made in the old style and tbe other in the newly adopted plan of illustrating the mines—not by vsrtical cross-sections, but by 50-ft. underground contours showing the limits of the beds in place and to great perfection. Tbe probabls outline of undeveloped portions can thus bs very satisfactorily determined.

The duty on bullion, heretofore taxed on being taken out of Mexico bas been annulled. So saye tbe Mexican Consnl at Tucson.

Useful Information.

How to Mix Paints.

Tho following table will bs found very serviceable to msny, especially to *amateurs*, as showing the msnner of mixing the simple colors to produce compouud colors:—To make a

Buff—Mix white, yellow ocher and red.
Chestnut—Red, black and yellow.
Chocolate—Raw umber, red and black.
Claret—Red, umber and black.
Copper—Red, yellow and black.
Dove—White, vermillion, blue and yellow.
Drab—White, yellow ocher, red and black.
Fawn—Whits, yellow and red.
Flesh—White, yellow ocher and vermillion.
Freestone—Red, black, yellow ocber and white.
French Gray—White, Prussian bluo and lske.
Gray—White lead and black.
Gold—White, stons ocbsr and red.
Green Bronze—Chroms green, black and yellow.
Green Pea—Wbite and chrome green.
Lemon—White and chrome yellow.
Limestone—White, yellow ocber, black and red.
Olive—Yellow, blus, blsck and wbite.
Orange—Yellow and red.
Peach—Wbits and vermillion.
Pearl—White, black and blue.
Pink—White, vermillion and lake.
Purple—Violst, with more red and white.
Rose—Whits and maddor lake.
Sandstone—Whits, yellow ocber, black and red.
Snuff—Yellow and Vandyke brown.
Violet—Red, blus and white.

In tbe combinations of colors required to producs a desired tint, tbe first named color is always the principal ingredient, and ths others follow in the order of their importance. Tbns, in mixing a limestone tint, wbite is tbe principal ingredient, and red the color of which the least is needed. The exact proportions of each color must he determined by experiment with a small quantity. It is best to havo tbe principal ingredient thick, and add to it tbe otber psints tbinner.

A New Method of Inlaying Wood.—A new metbod of inlaying wood has been contrived by a furniturs manufacturing bouse in England. The process is as follows: A veneer of ths same wood as that of wbich the design to be inlaid consists—say sycamore—is glued entirsly over ths aurface of any hard wood, such as American walnut, and allowed to dry thoroughly. The design is then cut out of a zinc plate ahout 1-20tb of sn inch in tbickness, and placed upon tbo vencer. The whole is now subjected to action of steam, and msde to travsl between two powerful cast-iron rollers of 8 inchss in diameter by 2 ft. long, 2 above and 2 below, which may be brought witbin any distancs of eacb otber by screws. The enormous prssure to wbich the zinc plate is subjected forces it completely into tbe veneer, and tbe veneer into the solid wood beneath it, whils the zinc curls up out of the matrix it has thus formed and comes away easily. All that now remains to hs dons is to plane down tbe veneer left untoucbed by the zinc, until a thin shaving is taken off tbs portion forced in the walnut, when the surface, being perfectly smooth, the operation will hs completed. It might he supposed that the result of this forcibls compression of the two woods would leave a ragged edgs, but this is not the case, the joint being so singularly perfect as to be unappreciable to the touch; indeed, the inlaid wood fits more accurately than by the process of fitting, matcbing, and filling up witb glue, as is practiced in tbe ordinary mode of inlaying.

How to Tell Good from Bad Gilding.—It may be ascertained whether gilding is genuins or not by ths fact that on the latter a weak solution of protocbloride of copper produces a black precipitate, which it does not on tbs former. In ths cass of gilt paper, the simplest method consists in slowly burning the paper in a bright flsme tbat gives out no smoke; in tbs incinerated remains of good gilt psper there ars traces of tbe gold left behind, wbich are quits perceptible to ths naked eye, in the shape of glittering spots, while base metal on paper oxidizes in burning, and leaves nothing hut a lot of red spots behind. This method, bowever, is scarcely accurate enough; a very much safer test is to be found in the use of mercury, either in metallic sbape or in solution of salts of mercury. The former test is performed by putting a few drops of purs quicksilver on the gilt article, and either rubbing it in or slightly beating it. If the gilding be genuine, though ever so thin, tbe mercury combines itself with it, producing wbite spots on ths surface. This does not occur in the case of sham gilding, and in rubbing mercury no change of color whatever can he noticed. Another test consiste in the application of a watery solution of nitrate of mercury. In this cass tbe exact opposite takes plac as in tbe former, for genuine gilding remains intact, wbile a "duffer" at once takes a whits color wbsn brought in contact witb ths precipitats of mercury.

Dogs in a state of natnre never bark; they whine or growl. The explosive noise is only found among tbose wbich have been domesticated,

Luminous Paint.

Ths London *Building News* says: The comparatively recent discovery that luminous paint can bs applied as ordinary wbitewash, considerably expands the field of its usefulness. Sheets of glass coated witb tbs paint form Alladin's lamps, which are in use in soms of tbs vessels of the navy, at the Waltham Powder Factory, at Young's Paraffine Works, and in the spirit vaults of several docks; but now that, hy increased production and the use of water as tho medium, the cost is reduced by ons-balf, it will probably be extensivsly used for painting walls and ceilings. The ordinary form of oil paint has already hsen applied in many ways to clock-faces, to name-plates and numbers and house doors, and to notice boards, such as "mind the step," "to let," etc. The paint emits light without combustion, and, therefore, does not vitiats tbe atmospbere. Several experimental carriages are now running on different railways, the psint being used instead of lamps, wbich are neccssary all day on account of tbs line passing through occasional tunnels. It is reported that a paper at Turin called *Light* is to appear sbortly, printed in ink which will bs luminous when darkness sets in. Who can say, indeed, tbat a policsman, when smeared in this luminous composition, will not bs somstimes visible on bis heat at nigbt?

How to Make a Luminous Paint.

The following method of procedure will, it is said, give a very satisfactory luminous paint: Take a number of oyster shells cleaned from organic matter as thoroughly as possible, and burn them in a strong coal fire for about balf an hour, at the end of which time take them out and allow to cool. When quits cold, pound them fine, removing, during this operation, any particles of grny matter that may show themselves, as tbess are nssless. When finely powdered, maks an intimate mixturs of tbis witb flowers of sulpbur. Introdnce tbe mixture into a crucibls, luting on a lid to the vessel with clay, or other conveuient luting material. When this is dried, place ths crucible in tbe fire and allow it to remain for an bour; tben remove, and allow to cool befors opsning. The mixture then should appear purs wbits. Any gray particles that havs escaped removal at the first preparation, sbould bs removed now. The resulting powder sbould bs mixed with gum water to a thin paint, as two tbin applications are bettsr tbsn one thick one. Tbis paint will remain luminous far into the nigbt, provided it is exposed to the ligbt during the day.

Good Health.

Effects of Smoking on the Heart.

Ws have often observed cases of intermittsnt pulse in wbicb the cause was unquestionably the use of tobacco, the difficulty disappearing in almost every case where the habit was abandoned. The *Sanitary News*, under the head of "Danger Signals," presents ths following interesting facts on this subject:

"Soms years ago, M. Decaisns drew attention to ths fact that tobacco smoking often causee an intermittent pulse. Out of 81 great smokers examined, 23 presented an intsrmittent pulse, independent of any cardiac lesion. Thie intermittency disappeared when ths habit of smoking was absndoned. He also studied tbs effects of smoking on children from 9 to 15 years of ags, and found that it undouhtedly caused palpitation, intermittent pulse and chloroanæmia. Tbs children, furtbermore, became dull, lazy and predisposed to tho use of alcoholic drinks. Recently be reportsd to the *Societe d'hygiene* (*Gazette Obstetricale*) ths results of his observations on the effects of smoking on women. Since 1865 he bas met with and observed 43 female smokers. Most of them suffer from disturbances of menstruation and digestion, and eigbt presented very marked intermittency of the pulse without any lesion of the beart. Hs gave detailed accounts of thess eight cases, in which all treatment directed against tbe intermittency proved utterly useless, while tbe supprcssion of tobacco was invariably followed by improvement, and very often by complets disappearances of the phenomenon."

Sand Bag for the Sick-Room.—Ons of tbe most convenient articlee to bs used in a sick-room is a sand bag. Get some clean, find sand, dry it thoroughly in a kettle on the stove; make a bag, about eight inches square, of flannel, fill it with the dry sand, sew the opening carefully together, and cover the bsg witb cotton or linen. This will prevent ths ssnd from sifting out, snd will also enable you to beat ths bag quickly by placing it in the oven, or even on top of the stove. After ones using this you will never again attempt to warm the fset or hands of a sick person with a bottle of hot water or a brick. The sand holds tbe heat a long time, and the hsg can bs tucked up to tbe back without hurting tbs invalid. It is a good plan to make two or three of ths bags and keep them on hand, ready for use at any time when needed. —*Herald of Health.*

How to Take Tincture of Iron.—To disguise the taete of tincture of iron: Dr. Haner recommends that tincture of tbe sesqnicbloride of iron be mixed witb simple syrup and then with milk. This mixture will not affect tbe teeth, nor will the styptic taste be apparent.

Eating Before Sleeping.

The Old Time Rule Reversed by an Advocate of Late Suppers.

Man is ths only animal that can bs taught to sleep quietly on an empty stomach. The brute creation resent all efforts to coax tbem to such a violation of tbs laws of nature. Tbe lion roars in ths forest until he has found his prey, and when he has dsvonred it hs slseps over until he needs another meal. Tbs horse will paw all nigbt in the stable and tbe pig will squeal in ths psn, refusing all rest or sleep until they are fed. The animals wbich cbew the cud bave their own provision for a late meal just bsfore dropping off to their nightly slumbers.

Man can train bimself to the babit of sleeping witbout a preceding meal, but only after long years of practice. As bs comes into the world nature is too strong for bim, and he must bs fed bsfore he will sleep. A cbild's stomacb is small, and when perfsctly filled, if no sickness disturbs it, slesp follows naturally and inevitably. As digestion goes on the stomach bsgins to empty. A singls fold in it will make the little slesper restless; two will waken it; and if it is husbed again to repose the nap is sbort, and tbres folds put an end to tbe slumber. Paregoric or otber narcotic may closs its syes again, bnt without food or some stupifying drug it will not slesp, no matter how bsaltby it may bs. Not even an angsl wbo learned tbs act of minstrelsy in a celsstial cboir csn sing a babs to sleep npon an empty stomacb.

We use the oft-quoted illustration, "sleeping as swestly as an infant," becsuss this slumber of a cbild follows immsdiatsly after its stomach is completely filled with wholesome food. Tbe sleep wbich comes to adults long bours after partaking of food, and wben the stomacb is nearly or quite empty, is not after the type of infantile rspose. There is all ths differsnce in the world bstween tbe slsep of refreshment and the sleep of exbaustion.

To sleep well ths blood tbat swells tbe veins in ths head during our busy bours must flow back, leaving a greatly diminisbed volume bshind tbe brow that latsly throbbed with such vehemencs. To digest well, this blood is nsded at the stomacb, and nearer the fountains of life. It is a fact establisbed bsyond tbe possibility of contradiction that slsep aids this digsstion, and that tbe process of digestion is conductive to refreshing sleep. It needs no argument to convince us of this mutual rslation. Tbs drowsiness which always follows the well-ordsrsd meal is itself a testimony of naturs to this inter-dependencs.—*New York Journal of Commerce.*

A Barbarous Entertainment.—The municipal authorities of Brussels ought to bs ashamed of tbemselves; a great fair is held in Brussels every year, at which, amongst othsr things, a silken dress is given by the city "to the woman wbo imbibes the largsst quantity of bot coffee in the shortsst time, and at tbe bighest temperature." No ons objects to ths authorities of Brussels providing amusement for their citizens. But surely soms sort of entertainment could have been thougbt of wbich would not bs positively injurious to those who take part in msking tbe fun. To drink a largs quantity of coffee at one tims is sure to barm one's health mors or less. How mucb more hurtful must it he to drink it at "the highest degree of temperature" possible. Surely, onr Old World friends have not yet lost ths barbarity of feeling wbich causes one man to delight in seeing anotber burt—wbich ie never happier than when gloating over anotber's pain.

Is a Rabbit Bite Poisonous?—The Castle Rock (Col.) *Journal* is responsible for ths following: "A man hy the name of Otis, living on Horse creak, was latsly bittsn by a rabbit, from the effects of whicb he almost lost his life. Hs was trying to catch ths rabbit for his little boy when the animal bit him on the tbumb; but be took little notics of it at tbs time. Ahout an hour afterward bis thumb began to pain him ssversly and swelled rapidly, so tbat he sent for a physician, who tbought be bad been bittsn by a rattlesnake. Tbs doctor at first could not bslieve it was the bits of a rabbit tbat caused tbs trouhlc; so, to fully satisfy bimself, he had several rabbits caught, with which he experimented. He found that tbe upper jaw contained a bollow tooth, from which he extracted a very poisonous fluid. He ascertained that two drops of this fluid administered to a lamb would kill it in lsss thsn an bour."

Cure for Snake Bites.—A discovery of great value to all parts of the world where venomous reptiles are common, and especially in tbe tropics, whsre thsy ahound, has hesn mads by Dr. J. B. Lacerda, sub-Director of tbs Laboratory of Experimental Physiology in the National Museum of Rio Janeiro, which will lead to their more general application. This ingenious scientist has proved that a solution of permanganate of potassium injected into ths blood is an infallible curs for snake bites. The remedy may he nsed as a simple snd availahls antidote not only for tbe bites of snakes, but for those of scorpions and tarantulas. Tbs experiments which led to tbe discovery were made upon dogs. An injection of a solution of ons part of permanganats of potash in 100 parts of water into the veins of the animals entirely removed the effects of strong doses of poison previously injected.

The new refinery of the Carson Mint is in full opsration and working to a charm.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Construction of Geological Cross Sections; Blasting in Collieries, 361. The Week; Boundaries of Mining Claims; Recent Discoveries of Egyptian Relics; Sources of Energy, 368. Insectivorous Plant, 369. Lecture to Young Mechanics and Apprentices, 372.

ILLUSTRATIONS.—Profiles of Geological Cross Sections, 361 Leaves and Flowers of Physianthus, Slightly Reduced; Trapped Moths and the Physianthus Blossom Dissected, 369.

MECHANICAL PROGRESS.—Erroneous Ideas of the Steam Engine; The Cost of Iron Castings; Sharpening Circular Saws, 363.

SCIENTIFIC PROGRESS.—The Prince of Planets; Electrical Insect; Malleable Iron; Electric Lighting by Incandescence; The Absorbing Capacity of the Earth; Constitution of Comets; Purifying Bisulphide of Carbon, 363.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meeting and Dividends, 364.

MINING SUMMARY from the various counties of California, Montana, Nevada, Colorado, Utah, Oregon, Idaho, Arizona and New Mexico, 364-65.

USEFUL INFORMATION.—How to Mix Paints; A New Method of Inlaying Wood; How to Tell Good from Bad Gilding; Luminous Paint, 367.

GOOD HEALTH.—Effects of Smoking on the Heart; Sand Bag for the Sick Room; Eating Before Sleeping; A Barbarous Entertainment; Is a Rabbit Bite Poisonous? Cure for Snake Bites, 367.

MISCELLANEOUS.—California Water Rights; The Schillot Process; Brief Mining Notes. Gold and Silver in Norway and Sweden, 362. The Upper Kern—The Kaweah Group, 366-7.

NEWS IN BRIEF on page 372, and other pages.

Business Announcements.

Extra Dividend Notice—Standard Con. M. Co.
Automatic Quicksilver Feeder—Whitney & Marshall, S. F.

Passing Events.

The now noted Gold Run case involving the debris question is still going on at Sacramento, but so far very little evidence has been brought forward except that tending to show the difference between the river beds now and what they were before hydraulic mining began. The testimony is very voluminous, which prevents our publishing it, but it may be found in the Sacramento papers.

December has been ushered in, here at least, by mild showery weather.

The time is at hand when claim owners, who have not already done so, should be taking steps to represent their claims. It no doubt has become somewhat monotonous with many to make the necessary outlay required from year to year without deriving any direct benefit, but the time surely will come when each and every mine that shows a mineral-bearing ledge will be found of value.

We intend on the 17th inst. to give a large double-sheet edition of the MINING AND SCIENTIFIC PRESS, devoted mainly to the interests of Arizona and New Mexico. This edition will be handsomely illustrated and will contain a large amount of original matter.

The snow on the mountains has driven in nearly all the prospectors in the mining regions, and they are now thinking over work done and laying plans for next season.

In California we will not show a very large figure of bullion product this year, owing to the cessation of work in hydraulic mines under injunction.

CAPT. J. G. RILEY, a mining man, formerly of this city, died in New York on the 15th ult.

Boundaries of Mining Claims.

In locating mining claims the law expressly states that the locator must mark his location by monuments, which will indicate to anyone its exterior boundaries. Fences are not required around mining claims. The physical marks upon and around the claim are sufficient to notify anyone of the claim of the possessor. Fencing would serve no useful purpose except to mark its boundaries; and any other means which will accomplish that object will equally answer the requirements of the law as to the possession of such a claim.

A claim of more than the number of feet allowed by law upon a quartz claim is void, for the excess, but setting stakes a few feet farther apart than the limit allowed by law, does not defeat the entire claim.

The object of the act of May 10, 1872, was to give to the discoverer his lode, with surface ground adjacent thereto, and within a certain distance on either side of that lode, and to avoid questions of vein identity; to give him in addition, all other veins within his surface location; but that if the vein originally discovered was not followed by a survey which included such vein, the surface ground allowed to the discovering vein and the side veins additionally granted, could not be construed to include the surface and the side veins within a lot of ground which did not contain the original vein first discovered.

Under the mining laws of the U. S., unaided by any supplementary miners' rules, there is no way of locating a quartz vein, except by marking out surface lines; and when these lines have been marked, they cannot be changed so as to take on ground that has been located by others, prior to such attempted change.

A location to a mining claim must be distinctly marked on the ground, so that its *boundaries* can be readily traced, but the law does not define or prescribe what kind of marks shall be made, or upon what part of the claim they shall be placed. Any marking of the ground claimed by stakes, mounds, or written notices, whereby the *boundaries* can be readily traced is sufficient if the center line of a location of a lode drawn lengthwise be marked by a prominent stake or monument, at each end thereof, upon one of which is placed a written notice, showing that a locator claims the length of said line upon the lode from stake to stake, and a specified number of feet or width on each side of said line, such location is so marked that the boundaries may be readily traced; and, so far as the marking of the location is concerned, is a sufficient compliance with the law.

The placing of a monument in the center of a mining claim upon a mineral vein and posting a notice thereon stating that "the undersigned claim 750 ft. easterly and 750 ft. westerly therefrom, together with 300 ft. on each side of the vein, with all its dips, spurs and angles," is *not* a sufficient compliance with the act of May 10, 1872, which requires locators of mining claims to distinctly mark their locations on the ground so that their boundaries can be easily traced.

The posting of a notice upon a tree at each end of a mining claim is not a sufficient compliance with the law requiring the location to be distinctly marked.

ABOUT MINING.—The Chicago *Mining News*, speaking of men talking about the business of mining, just as though it was something that had not occupied the attention of men from the remotest times, says: "This senseless stringing out by the mining press of long, tedious articles under the caption. 'Does Mining Pay,' or 'Is Mining a Legitimate Industry?' should cease. The day for this has passed away. Everybody knows that mining pays, and it has won its way as a legitimate industry when properly conducted, though it can be made illegitimate and profitless by criminal or careless management. More attention should be paid to the dissemination of mining news, letting the industry take care of itself. It would be thought the hight of absurdity to see in a commercial journal a string of words beaded. 'Is Commerce Legitimate?' But the very men who scout such an idea as this will fill a column or more with the very self-same stuff about mining."

GRAVEL DEPOSITS.—On Tuesday a long dispatch came from Washington and was published in the city dailies as the Director of the Mint's theory of the formation of gravel deposits. This "Theory" was written by the editor of this journal, and published in the MINING AND SCIENTIFIC PRESS some months ago. The Director of the Mint used it in his report and gave proper credit for it. It is amusing now to see the article published here where it appeared six months ago; when it had to go east, receive the "stamp" of a Government official, and be telegraphed back before it received recognition.

WM. CORBERT, a miner employed in the Wakeeshow Co.'s claim at Relief Hill, Nevada county, was killed recently by being caved on and then washed through a long flume. The force of the falling dirt precipitated him into the flume, and as there was a full head of water running, he was washed through it. Death probably resulted from drowning.

LEAD in Salt Lake is $48 per ton.

Recent Discoveries of Egyptian Relics.

Our readers are already acquainted with the fact of the recent remarkable discovery of a wonderful collection of ancient Egyptian relics in a cave near Thebes. The full particulars of this discovery have now come to hand. It appears that for eight or nine years past certain natives of a mountainous region near the ruins of ancient Thebes have been offering for sale to travelers and others numerous relics. The readiness with which they were bought up, so stimulated the trade that within a year or two the Egyptian authorities have come to the conclusion that there must be some secret deposit of such things known only to a few of the natives in question. Acting upon this presumption, and feeling that if there was such a deposit it should be placed under the control of the government, the authorities, last spring, employed the well-known scientist, Mr. Emel Brugsch, to go to Thebes and endeavor to find out the locality from whence these relics were derived. Having arrived, Mr. Brugsch soon succeeded in discovering the immediate neighborhood of the deposit, but was for some months baffled in discovering the exact locality. Circumstances finally pointed out a native who it was believed knew all about it. He was immediately arrested and called upon to divulge his secret. Of course he professed ignorance, but as assured was the government agent that he was given but six hours to tell all he knew under threats of severe punishment. At the expiration of the six hours, the native, still remaining obdurate, was cast into prison. The news of his arrest soon reached the ears of his brother, when this second individual came forward and promptly revealed the secret, and conducted Mr. Brugsch to the tomb or cave.

The locality, which is known as Der-el-Bahari, is among some low hills and rocky ravines upon the immediate border of the Theban plain. The place had evidently been entirely hewn out of the soft limestone rock, or was a natural cave enlarged by human agency. The entrance, which was carefully concealed among naturally projecting rocks, was a narrow passage about 40 ft. in perpendicular depth, and opened into a horizontal gallery of much larger area, and about 180 ft. long. The floor of this gallery was perfectly covered with coffins, mummies, statues and statuettes, and boxes filled with every variety of most valuable relics, manuscripts, inscriptions, preserved flowers and other funereal relics, etc. In this dry and rainless country, and at the hight of some 200 ft. above the neighboring plain, all these remains had been perfectly preserved in this limestone cave or tomb for 3,000 years, even more carefully than they could have been for so long a time in the best located museum above ground in any part of the world.

Four days after the discovery a government steamer, which had been telegraphed for, brought up the Nile to a point near the locality, and some 300 natives at once set to work to remove everything from the cave to the decks of the steamer, which was soon covered with the most precious freight which was ever floated at any one time upon the waters of that sacred river. The work was carefully and safely accomplished, and all was soon transferred to the Boulaq Museum of Antiquities.

Mr. Brugsch thus describes what he saw when he first entered this tomb: "My astonishment and bewilderment was so great and overpowering that I hardly knew whether I was awake or whether this was only a dream. I seated myself on a coffin to recover from the enormous excitement, and glanced at the lids of the various coffins, and clearly and distinctly saw the name of King Seti I., the father of Ramses II., both of the 19th dynasty. A few steps further on, in a plain wooden coffin, and with his hands crossed on his breast, lay Ramses II. himself. The farther I advanced, all the greater and grander were the riches that appeared before me. Here Amenophis I., there Amosis, the three Thotmes, the Queen Aahmes-nofert-ari, the Queen Aah-hotep, all the mummies being perfectly preserved—altogether, 36 coffins of kings, their wives, princes and princesses."

Our readers will generally feel more deeply the value of these discoveries when it is known that among the royal mummies are to be seen the embalmed bodies of Thothmes III, who lived about B. C. 1600, and Ramses II, who lived about 1330 B. C. It was the former who is supposed to have ordered the execution and erection of the two obelisks, one of which now ornaments the Thames embankment, in London, while the other stands in the Central Park at New York. They, in all probability, were originally placed as twin monuments upon either side of some grand gateway, either at Thebes or Heliopolise.

It is difficult to realize the fact that, side by side in the museum, one can now see the actual bodies, inclosed in their respective cases, of men whose orders caused the execution of these monuments which, in almost perfect preservation, have survived 3,000 years. It is curious to note in these cases containing the royal mummies the flowers (among the number the now obsolete lotus), and garlands with which it was the custom to encircle the neck of the embalmed body after swathing with cloth, perfect in form, but perhaps not unnaturally faded and dry. Among the writings are four large papyri rolls, from the translation of which much is expected; also many elaborate vases containing the hearts of defunct kings, queens, etc., several thousand small statuettes, a large number of ceremonial wigs perfectly preserved, four bronze chairs, etc., together with 46 boxes and chests of small articles of various kinds.

It is supposed that these royal mummies and other relics were removed from their original resting places to prevent their being desecrated by an invader, perhaps Cambyses, and placed for safety in the pit just discovered. This would seem to be corroborated by the fact that Belzoni found and took away to England a sarcophagus, but without any mummy, some years ago, and that the body for which that same sarcophagus was made, and said to contain at one time, is now found among the number collected in the Der-el-Bahari, and now lying side by side with the supposed father of Ramses II, during whose reign Moses was born. One of the most magnificent of the mummy cases is that containing the body of King Ramses' daughter (possibly the identical lady who found Moses in the cradle among the bulrushes), which is in a most perfect state of preservation, looking as it lies in its coffin, just as if it had only a few hours previously left the hands of the people whose duty it was to embalm and swathe it in its cloth.

Every one will await with impatience the translation of the various papyri, which form anything but the least important portion of this discovery, and may possibly prove its most valuable feature, as throwing conclusive light upon many points which are now much disputed among *savants* of Egyptology.

Sources of Energy.

In looking over Mr. Moore's lecture (which we give on page 372) on "Mechanical Powers," the kindred subject of "Sources of Energy" comes to mind; that is, sources of energy or nature which are available to man for the production of mechanical effects. Water, wind, electricity, we all recognize, and many dream of wave power or tide power. At a recent meeting of the British Association for the Advancement of Science, to the question whether the motive power of the tides could be employed for turning machinery, Sir Wm. Thomson gave an answer in the affirmative, but said he did not think it could be economically employed, inasmuch as the necessary dock construction would generally be far too expensive an item in its application. Still, he admits that there are, perhaps, half a dozen places in the world which are so situated that the tidal energy might be advantageously utilized as a motive power. Turning, however, to the wind, Sir W. Thomson finds a natural source of energy which is far more hopeful. Notwithstanding the advance in the use of steam, there is a vast amount of the world's work still done in the old-fashioned way—by means of wind. Witness the large number of sailing ships compared with steamers. On land, however, wind has not attained an equal importance. But Sir William argues that when our supply of coal shall become exhausted, or even when the fuel shall become unreasonably expensive to procure, on account of the depth, the danger and the heat of the mines, we may then turn with advantage to the wind. It is just possible, however, that the windmill may be replaced by some improved form of wind motor.

It is interesting to note in this connection the water-power which the American nation has at its disposal. In an address lately delivered before the Bankers' Convention at New York, an estimate was made of the large amount of horse-power obtained by damming up the following rivers—viz., the Passaic, at Patterson, 1,000 horse-power; the Merrimac at Lowell, 10,000; the Mohawk at Cohoes, 14,000; the Connecticut at Hardley, 17,000; the Mississippi at the Falls of St. Anthony, 16,000; the Androscoggin at Lewiston, 11,000; the Housatonic at Canaan Falls, 3,000; and the Oswego at Oswego, 4,000. The sum total of these is 75,000 horse-power, as estimated at a given point in each river. But this is used over again on an average not less than three times, showing a larger total of 225,000 horse-power. There are also many smaller streams in all the hill sections of the country which are utilized, and would furnish an aggregate equal to the last named figure. This great force of water power is, of course, likely to be thrown altogether in the shade by the proposed plans to utilize Niagara, by placing three turbines, 4 ft. in diameter, with 80 ft. of head, fed by a tube 7 ft. in diameter, each turbine giving 1,000 horse-power, with the whole strength of the great lakes and the Niagara river to reinforce them. The average flow of the river above the falls is 10,000,000 cubic ft. per minute. Converting this into horse-power under a head of 200 ft., a grand aggregate is obtained of 3,000,000 horse-power—a mighty force, sufficient to supply the economic wants of 200,000,000 people.

PROF. HENRY A. WARD has written from Singapore to the President of the California Academy of Sciences to say that he will not be able to reach San Francisco until the new year, at which time he proposes to exhibit his splendid collection of geological curiosities.

BRISTOL DISTRICT, Nev., will soon have a newspaper. The material of the old Tybo *Sun* has arrived there. The newspaper will be the Bristol *Times*.

Insectivorous Plant.

Physianthus Albens as a Moth Trap.

At the last regular meeting of the California Academy of Sciences, Robert E. C. Stearns read the following paper "On the Botanical relations of *Physianthus albens*, the Structure of its flowers and their peculiarities as an Insect Trap:"

The plant to which your attention is called is one of a highly interesting group; and this group is also related to many other groups which possess various important economical characters. Some of these have been known for a long time; others invite inquiry and afford a peculiarly fertile field for the investigations of the student in organic and pharmaceutical chemistry.

The species before us may be seen in many gardens and housyards in and around San Francisco and Oakland. At Berkeley upon the University ground and the private grounds in the neighborhood. Its rapid growth, hardy habit, clean shining leaves and sweet scented flowers, making it a favorite plant for ornamental purposes. The botanical name (I know no other) is *Physianthus albens*; it is a native of Buenos Ayres, and has been introduced as far north and east as Massachusetts, where it thrives as well it does here; it has also been noticed there as a moth-trap.

The genus *Physianthus* is included by botanists in the natural order of *Asclepiadaceæ*, of which some of the forms are popularly known as *Milkweeds* on account of the character of the sap, which exactly resembles milk.

Before proceeding farther with the milkweeds I will mention the principal related large groups like the Phloxes (*Polemoniaceæ*), ornamental chiefly, and natives of temperate latitudes, principally in North and South America; the Dodders (*Cuscutaceæ*), parasitic in their habits, and found in the temperate parts of both hemispheres, and unfavorably known here in California as a parasite on the *Alfalfa*, around the stems of which it winds its fatal thread and strangles the plant by preventing the upward flow of sap. The bindweeds (*Convolvulaceæ*) popular in some of its species by reason of their showy flowers; otherwise known by the sweet potato; from this group also Jalap scammony and the oil of rhodium are obtained. The plants abound in tropical, but are scarce in cold climates. The Sebestens (*Cordiaceæ*), mostly tropical forms, in both hemispheres, with panicled flowers and drupaceous fruit, some species of which are edible. The Deadly Nightshades (*Atropaceæ*), herbs or shrubs, with a wide distribution, include tobacco, henbane, mandrake, etc. The Nightshades (*Solanaceæ*): Among these are found favorite vegetables, like the potato and tomato, also the egg plant and other useful forms. The Olives (*Oleaceæ*), mostly inhabitants of the temperate zones, and principally known by the olive, whose drooping fruit is so largely used as human food, and otherwise familiar to us by the common lilac of our garden, also by the flowering ash and privet.

Having briefly noticed the principal groups related more or less directly to the *Asclepiads*, or milkweeds, let us now return to this latter group, with which our moth-trapping flower is more intimately connected.

Baird says:* They are chiefly shrubs, usually possessing a milky juice, and often twining. They inhabit, for the most part, warm and tropical regions, though there are many natives of northern latitudes. In general, they have acrid purgative, emetic and diaphoretic properties. The milky juice is usually bitter and acrid, but occasionally it is bland, and is used as milk, as in the case of *Gymnema lactiferum*, the cowplant of Ceylon, which the Cingalese use for this purpose. Many of the species of the genus *Asclepias* possess powerful medicinal properties. The roots of *A. curassivica*, or bastard ipecacuan of the West Indies are emetic, and are frequently sent to England as ipecacuanha.

The roots of *A. tuberosa*, or tuberous swallowwort of North America, are famed for their diaphoretic qualities, and are used in Virginia in inflammatory diseases. The sap of *A. Syriaca*, or Syrian swallowwort, is recommended as an expectorant. It is white, and contains a considerable quantity of caoutchouc. The nectaries or leaflets of the crown act as fly traps. The seeds of this and some other species are covered with down, which is well adapted for stuffing mattresses and pillows. They are hence sometimes called cotton plants. A good many of them are cultivated in Europe for their beauty. Their flowers have curious horned processes added to the corolla. The species of the genus *Stapelia* are singular-looking plants, forming at the Cape of Good Hope a stunted, deformed vegetation in the form of leafless succulent plants resembling some of the *Cactuses* and *Euphorbias*. The flowers are often very fetid, and are consequently called carrion flowers.

The leaves of *Solenostema argel* are used in Egypt to adulterate senna, and the fragrant roots of *Hemidesmus indicus* are used in Madras as a substitute for sarsaparilla, under the name of country sarza. The celebrated Hindoo medicine, mudar, used as a diaphoretic in India, is procured from the bark of the root of several species of *Calothropis*, especially *C. gigantea*. It contains a principle called Mudarine, which gelatinizes upon being heated and becomes fluid on cooling. Some of the species of the genus *Cynanchum* act as purgatives; the *C. monspeliacum* furnishing what is called the Montpellier scammony, and being used to adulterate the true scammony. Some of the genera furnish species which yield a dye said to be similar to indigo. The *Hoya carnosa* has a peculiar, waxy-looking blossom, and is called the wax flower. The silk plant of Madeira, *Gomphocarpus fruticosus* belongs to this family.

"The juice of *A. tuberosa* (pleurisy root, butterfly weed) is not milky. In all it is bitter and acrid, and contains Caoutchouc. The roots, etc., are diaphoretic, emetic or cathartic. The inner bark yields abundance of very long and fine, extremely strong fibers."*

From the foregoing glance at the various properties of the milkweeds, of which much more might be said, the structural peculiarities of their blossoms which are curious through the connection of the stamens with the stigma and the cohesion of the pollen into wax-like or granular masses, which are attached in pairs to five glands of the stigma, and removed from the anther-cells usually by the agency of insects (Gray id.), and equally or more curious as forming in the species presented herein, a simple but effective insect-trap, especially for certain moths.

A year ago this month I noticed upon the flowers of this plant *Physianthus* or *Araujia albens* growing in the flower-bed along side of the front porch to my house at Berkeley, and running up on the porch-rail, several moths fluttering as if trying to get away from the blossoms; upon careful examination I found they were in some way fastened to the flower, and were held by the proboscis, of which the tip was submerged or hidden in the interior of the blossom. Besides the living moths I found several dead ones, also hanging by the proboscis which was attached to the flower in some way. Knowing that so many of the plants of this group are poisonous, at first thought it occurred to me that the insects might be poisoned or perhaps intoxicated by some peculiar property of the nectar.

Supposing that I had made a new discovery, as to the insect-catching, or, more properly, moth-trapping peculiarity of *Physianthus*, I dissected blossoms to which moths were attached, and found that whether the nectar was harmful or otherwise, the trapping was wholly mechanical and due to the peculiar form of the anthers. After making drawings of the plant, its flowers and the various parts of the flower, so as to show the construction of the trap and related parts, I sent specimens of the moth East to my friend, Dr. Packard for identification. In the meantime, I learned that *Physianthus* as a moth-trap had long before (*American Naturalist*, Jan. 7 and Feb. 7, 1880) been noticed, and by several parties at various times; more recently in Providence, R. I., Springfield and North Woburn, Mass., and notes of these observations had been published from time to time.

The matter, however, was new to me, and the investigation an ample reward for the trouble. It is none the less interesting because previously made known—though for this reason I have not brought it to the attention of the Academy before. My interest in the subject has also been revived by the recurrence of the moth season, and consequently additional and recent observations. On Saturday last (Nov. 5th) I detected the first entrapped moths of the season, *nine* in number, some dead, others apparently just caught. On Sunday (yesterday) Nov. 6th, eight or nine more, some just alive, others just caught; this morning (Monday, Nov. 7th,) five more; (Tuesday, Nov. 8th, windy and cold day,) two; (Wednesday, Nov. 9th, windy and cold,) two.

In figure 1 we have a spray of Physianthus, which gives an idea of the general aspect of the plant, its leaves and flowers.

In figures 2 and 3, the flowers with the moth upon them showing a back and also a side view of the insect.

In figure 4 the perianthum or perigonium constituting a single flower or blossom.

5 The stamineal mass or corona staminea, *a* is the anther wing, *b* exterior spurs to anther.

6 Gynecium, showing ovaries *a*, stigma *b*, pollen-masses *c*, and glands *d*.

7 Anther, showing wings *a*, and exterior spur *b*.

8 Side view of anther, showing wings *a*, and spur *b*.

9 Oral view, showing how the spurs head in and up against the winged anthers, and the edges of the wings of the anthers in pairs.

On turning to the figure of the flower it will be noticed that it is trumpet-shaped, flaring at the mouth where the petals divide then uniting and forming a tube which is swollen into a bulbous form where the corolla joins on to the calyx.

Now this exterior tube being pulled off reveals the anthers with their exterior spurs, pressing against the gynecium and hiding the ovaries and the pollen.

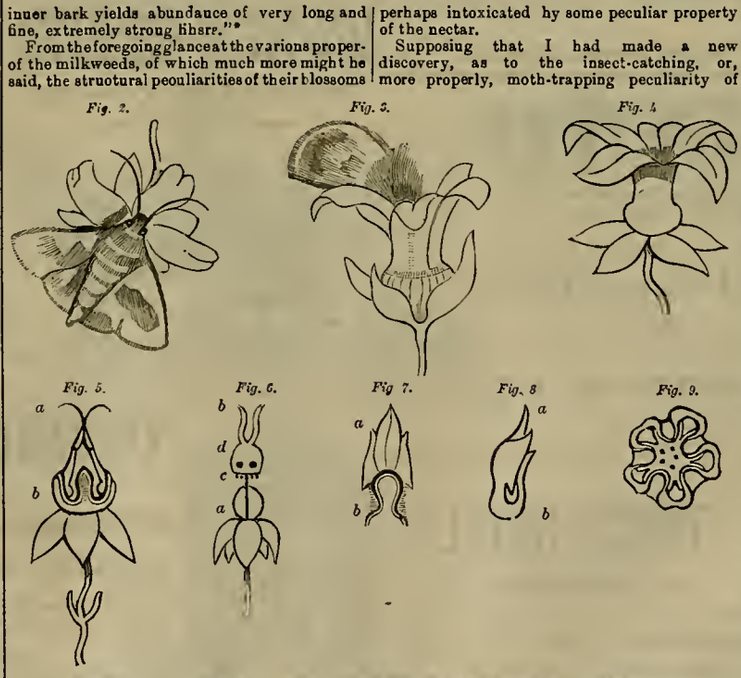
The moth in pursuit of the nectar, which is inside of the anthers near the top has to thrust the proboscis down the tube of the flower, describing a curve between the exterior of stamineal crown or mass and the inside of the hulh of the perigonium, then push the proboscis upward between the edges of the anther wings, as far as may be necessary to reach the pollen masses, and after sucking until the nectar is exhausted or hunger is satisfied, attempts to withdraw the proboscis from the flower; but the edges of the two anthers, between which the proboscis has been thrust, being rigid and angular, act as a vise, or in the same way that a boot-jack holds a boot, and the more the moth pulls the tighter the grip; so unless the flower has reached that degree of maturity, so that it has begun to wilt before the vitality of the moth is too far exhausted, escape is impossible. When its flower begins to wilt the tissues are so softened that a vigorous moth may sometimes escape.

The species of moth which is most frequently trapped in the East is *Plusia precationis*, and it is an interesting fact that the species which I have detected at Berkeley, as the victims of this plant, belong to the same genus though not of the same species.

In a single instance I have also obtained a butterfly of the species known as *Pyrameis Caryæ*.

Other insects, ants, beetles, etc., are often found in the nectar of this flower, but not as prisoners.

FIG. 1.—LEAVES AND FLOWERS OF PHYSIANTHUS SLIGHTLY REDUCED.



TRAPPED MOTHS AND THE PHYSIANTHUS BLOSSOM DISSECTED.

NOVEL ENGINEERING OPERATION.—Some time since the United States Government decided to abandon the barracks and quarters on Goat island, in San Francisco bay, and all the property was removed. Lately it was found that new buildings were necessary at the Presidio and the idea occurred to the officials to remove the Goat island buildings to that place. The distance by water from the island to the Presidio is some five miles. The officers' quarters were separate, two-story buildings, with verandahs, etc. These were separately launched on to large scows and then the scows with their top-heavy freights were towed by the U. S. steamer *General McPherson*, to the Presidio beach. Here the houses were disembarked by means of skids, and then drawn into position on the Presidio grounds. The larger buildings were removed in sections. The officers' houses were taken singly and not broken in any way, even the brick chimneys, three in each house, remaining in position. It was quite an undertaking to remove such large structures in the manner indicated.

J. W. PINKERTON, for the last 16 years superintendent of the Pittsburg coal mine, in Contra Costa county, has resigned his position and gone to New Tacoma, Washington Territory, to take charge of the railroad companies Carbon Hill coal mines. The Mount Diablo people were very reluctant to lose Mr. Pinkerton, who has been a faithful and efficient officer; but the offer of the railroad company was too tempting for that gentleman to refuse, and too high for his old employers to compete with.

PARTIES who own patches of timber out along the line of the Carson and Colorado railroad are now able to get some money out of their property. Many of these men have been holding their claims for years, without knowing just how they were to get any profit out of them.

THE FRANKLIN GIRDER!

BY FAR THE MOST ECONOMICAL OF ANY CONSTRUCTION MADE.

This new and economical Girder for Buildings and Bridges, made of any desired length and to sustain any required load, and guaranteed to be fully up to the sustaining capacity represented. The price of these Girders is ABOUT ONE-HALF the price of those of same length and same sustaining capacity in common use in this city. The value of this invention has been most favorably commented on in full by most of the scientific press of this country, as the SCIENTIFIC PRESS, *Scientific American, Railway Review, The California Architect and Building Review, The American Architect and Builder.* A Girder 25 feet long, made for 17-inch wall, with about 2 feet of brick wall on it, is now in front of premises 231 First St., above Shot Tower. This Girder held on the top of the brick wall now on it, 117 Tons and 1,741 Pounds of Railroad Iron, at the Pacific Rolling Mills, piled directly over and between supports, and it would have held, in the opinion of experts 200 tons, as the deflection was not a quarter of an inch below the true arc. The foundation on which the Girder rested, settled 7 inches, so that the loading had to be stopped at the above weight.

The Price of these Girders, 25 feet Long, to Sustain 100 Tons as a Safe Distributed Load, $200.

THOSE IN COMMON USE NOW IN USE IN THIS CITY COST NOT LESS THAN $400.

And other sizes in like proportion. Every Girder guaranteed to sustain the load as a safe one; the breaking load being three times greater.

Prices for any Size and Sustaining Capacity given on Application.

P. H. JACKSON & CO., Makers,
2 California Street, and 231 First Street, San Francisco, Cal.

P. H. JACKSON,
Civil Engineer.

PATENT RIGHTS FOR STATES FOR SALE.

Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.

It makes smooth and even lumber, leaves no stubshot, and will cut any sized log up to four feet in diameter.

It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to
CHANDLER & TAYLOR, Indianapolis, Indiana.

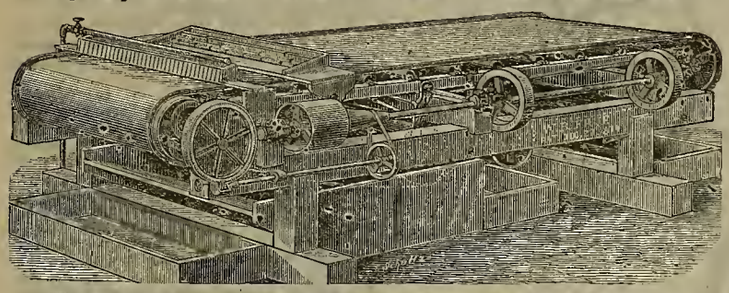
We also build the heavy Standard Circular Saw Mill, with either one or two saws as well as the Pony Circular Saw Mill that is capable of being run with light power. We also build Stationary Engines of varied capacity, also portable Threshing Engines.

THOS. PRICE'S

Assay Office and Chemical Laboratory,

524 Sacramento St., S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

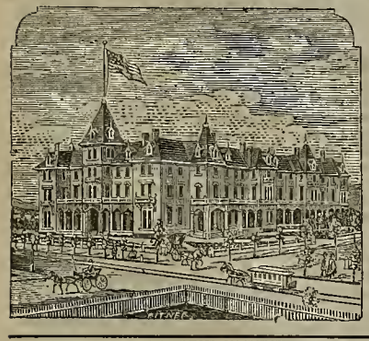
Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,
SAN FRANCISCO, CAL.



TUBBS HOTEL,

East Oakland,

Having been Thoroughly Refitted and Refurnished, Painted and Frescoed, is now Open for the Reception of Guests. Rooms can now be secured at the Hotel.

S. I. KELLOGG, PROPRIETOR.

"FRUE" ORE CONCENTRATORS.

I have on hand and for sale, at LOW PRICES, a number of the above Concentrators, of the latest pattern and in perfect order.

JOSHUA HENDY,
Manufacturer of Quartz and Saw Mill Machinery

AGENT FOR "BAKER'S" ROTARY PRESSURE BLOWERS,

Hot Polished Shafting from the Akron Iron Company, Ohio. Also, "P. Blaisdell & Co.'s" Machinists' Tools. A Large Stock of New and Second hand Machinery at Machine Works.

Nos. 49 and 51 Fremont Street, San Francisco.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

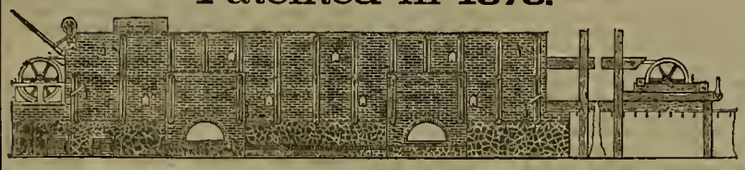
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

THE O'HARRA CHLORIDIZING FURNACE.

Patented in 1878.



SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnaces.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Frsiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ores to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella O. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 8½% to 95% of the assay.

SEND FOR DESCRIPTIVE CIRCULAR TO

Carson City, Nevada.

Agents for San Francisco, KUSTEL & CO., 318 Pine Street.

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Seperators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

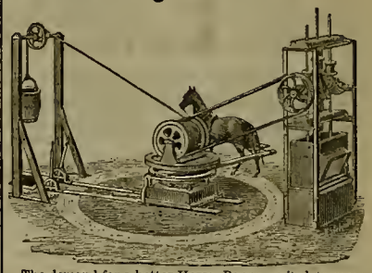
New Mining Horse Power.



The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.

This power is light and strong, so that two or more horses can be used for crushing ore or other work.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING NOVEMBER 15, 1881,

249,499.—PUMP—L. Bouvier, San Diego, Cal.
249,581.—VEHICLE GEAR—G. G. Buckland, Tulare, Cal.
249,606.—ADDING MACHINE—P. C. Forrester, S. F.
249,607.—JOURNAL AND BOX—Wm. H. Foye, S. F.
249,640.—HAY PRESS—L. B. Lathrop, Hollister, Cal.
249,650.—PACKAGE FOR TRANSPORTING LIQUIDS—H. Mattullath, S. F.
249,485.—CLUTCH FOR CONVERTING MOTION—J. W. Ross, Santa Clara, Cal.
249,701.—EXPLOSIVE COMPOUND—Thos. Varney, Oakland, Cal.
249,561.—FRUIT AND BERRY BOX—C. W. Weston, S. F.
8,841.—TRADEMARK—Quicksilver Mining Co., S. F.
249,720.—CRANK HANDLE—C. T. Wright, Bodega, Cal.
249,482.—DEVICE FOR MECHANICALLY OPERATING MUSICAL INSTRUMENTS—C. C. Reynolds, Kelseyville, Cal.

FOR THE WEEK ENDING NOVEMBER 22, 1881.

249,869.—SULKY PLOW—Geo. Applegate, Yoncalla, Ogn.
249,890.—SULKY PLOW—L. Brown, Waitsburg, W. T.
249,901.—CHURN—A. H. Conkling, Vallejo, Cal.
249,921.—FLAX-PULLER—S. W. Gaines, Scio, Ogn.
249,764.—WINDOW SCREEN ATTACHMENT—B. T. Herold, Stockton, Cal.
249,973.—DISH-WASHING MACHINE—W. C. Nelson, Santa Rosa, Cal.
249,701.—AMALGAMATOR AND CONCENTRATOR—C. W. Patten, S. F.
249,995.—MACHINERY FOR CONVEYING AND CRUSHING ORE—J. Richards, S. F.
249,996.—PNEUMATIC MACHINERY—J. Richards, S. F.
250,015.—ORE-ROASTING FURNACE—Jas. M. Thompson, San Francisco.
249,814.—RUNNING GEAR FOR VEHICLES—E. Whitmore, San Francisco.
250,027.—DRAW BRIDGE—E. A. Wible, Brighton, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Lectures to Young Mechanics and Apprentices.

Mechanical Powers.

On Thursday of last week, Robert S. Moore, son of Joseph Moors, of the Risdon Iron Works, delivered a lecture as one of a course now being given to the young mechanics and apprentices of this city. The subject chosen was "Mechanical Powers." Most of the lecture was devoted to establishing the first principles of mechanical power with application to levers, pulleys, chain tackles, cranes, etc., and in establishing the principle of work together with a good understanding of the unit of mechanical power, namely, the foot pound. We present the following as a synopsis of young Mr. Moore's remarks:

You remember that in the lectnre delivered here two weeks ago by Mr. Richards, on the subject of "Constructive Processes," he gave us a certain classification into which everything in the domain of machinery could be included. His four classes were, as I remember them, machinery of transmission and distribution; machinery for utilizing natural forces; machinery of power and machinery of transportation.

At the same time he offered the suggestion that some one in the audience would take up either of these subdivisions for an evening's talk, and for want of a more appropriate subject I have followed his advice, and will therefore ask your attention to-night to the subject of "Mechanical Powers."

While I am sorry to detain those who are already familiar with this most important branch of mechanics, yet, at the same time, I feel it my duty to address myself to those for whom these lectures were solely originated, namely—the young mechanics and apprentices of San Francisco.

To them I would say that in order to derive any benefit whatever from a lecture of this nature, they must pay the closest attention possible, no matter how dry and uninteresting it may seem to be.

On their account also I have prepared a lecture of the most rudimentary character, and hope to hear no one say that the subject selected was too deep for them. On the contrary, I have assumed that those present never heard of mechanical powers before, and therefore my remarks cannot fail to be within the comprehension of all.

Mechanical powers are certain machines which enable us to apply economically large forces to produce small effects, and small forces to produce great effects, and which are further capable of transferring forces from their natural point of action to another point of application.

The Combinations and Arrangements of Mechanical Powers

Are numberless, but the primary elements of which each and every one is composed are two and only two, namely, the lever and the inclined plane, the former of which will occupy most of our attention to night. By the lever, as you will observe from the figures upon the board, power is transmitted by circular or angular action and by the inclined plane by rectilinear action, the principle of the lever as will be hereafter shown, being the basis of the wheel and axle, while the principle of the inclined plane is the basis of the wedge and screw. In other words, pulleys are nothing more or less than levers of particular kinds, and similarly wedges and screws are only different forms of the inclined plane.

The elementary lever is an inflexible straight bar turning on an axis or fixed point called the fulcrum, the force being transmitted by angular action about the fulcrum from the point where power is applied to the weight to be raised.

Levers are of three varieties, according as the fulcrum, the weight or the power, is placed between the other two, but the action in every case is reducible to that of three parallel forces in equilibrium. [Here the three kinds of levers were shown by sketches on the board].

These are therefore the three and only three classes into one of which all levers, pulleys, wheels, etc., of every conceivable description can be included.

Having explained these various levers, we are now ready to investigate their powers and show the advantages to be gained by the use of them. This we shall do by

The Principle of Work.

Not that it is the simplest or most generally used method (for I have never seen the subject treated in this manner before), but because it introduces the all important foot pound, the true meaning of which should be thoroughly instilled into the mind of every apprentice, before he can ever succeed in obtaining a true knowledge of either theoretical or applied mechanics.

As hydrogen is the unit of atomic weight, so is one foot pound the mechanical unit. As one cubic foot of distilled water is the unit of specific gravity for solids, so also is the one foot pound the unit of mechanical power. By the term foot pound we mean one pound raised one foot high per minute; in other words, it is a relation between time, space and weight raised, which is recognized by the engineers of the whole world as the standard basis for their mechanical calculations.

We have, then, from the definition of one foot pound, the mechanical work developed in raising any weight (expressed in foot pounds) equal to the weight of the body into the distance through which it is raised per minute. [Here the lecturer drew illustrations representing graphically the foot pound, and also the amount of work developed in raising the different weights through given distances.]

So far, I have spoken of these various weights moving through certain distances; but it is evident that it is the same thing, whether we say one pound moves through a distance of one foot per minute, or with a velocity of one foot per minute.

Hence, in future when I speak of the velocity per minute, you will know that it means precisely the same thing as distance traveled per minute, the two words being interchangeable.

In the above illustrations I have purposely taken simple weights and heights, so that you would instantly recognize the fact, that the different weights and the respective heights to which they are to be raised, varied according to a certain law, which in mechanics is called the

Principle of the Equality of Movements,

And which, by referring to the above figures, can be enunciated as follows: "What we gain in weight we lose in velocity, and what we gain in velocity we lose in weight." Upon this one principle hangs the secret of all mechanical power.

This then, together with the definition of a foot pound, is all I ask you to memorize; if you forget it deduce it again for yourselves; if you have paper and pencil with you now, write it down as a basis for all future investigation of mechanical powers.

The speaker then referred to the crane, band winch, block and fall, hydraulic jack and differential pulleys, as practical examples of mechanical powers, showing by sketches how the power of each depended upon the above fundamental principle and, furthermore, how any apprentice present could readily calculate the power of the most intricate machine, providing he knew the number of feet traveled by the power for every foot traveled by the weight.

It was the want of a true understanding of this principle of velocities that had misled so many would-be inventors in their useless search for perpetual motion.

He also showed why perpetual motion could not exist; how one pound of work expended could only produce or develop an equivalent amount of work.

He also showed how, in moving heavy weights by tackles, the common error was made of passing the hauling part around a pulley attached to some rigid wall instead of first passing it around the movable pulley attached to the moving weight, thereby gaining twice the power.

The incline plane and its different forms (the wedge and screw), were next discussed.

The wedge, the power most commonly used in the mechanical arts, was dwelt upon at length. He showed that instead of raising a weight by moving it along the inclined plane, the same thing was accomplished by pushing the inclined plane under the weight.

After explaining to the apprentices what a horse power was, and that the object Watt had in adoptiog it was to establish the relation between the power of a horse and a certain-sized engine, he closed, hoping that the next time the attention of those present was attracted to any weight he raised, the principle of velocities would rise unconsciously in his mind, clearing away that which before was doubt; that which until now was mystery.

News in Brief.

FIVE hundred Danish farmers have located in Falls county, Tex.

IT is reported that tin has been discovered on the Bitter Root, in Montana.

LARGE herds of buffalo have recently been seen at Glendive, in Montana.

THE first mine in the United States was discovered in South Carolina in 1790.

THE production of iron ore on Lake Superior is now over 3,000,000 tons annually.

GEN. SHERMAN recommends fewer garrisoned posts and forts and a larger standing army.

THE subscriptions to the Garfield Memorial Hospital at Washington, have reached $86,000.

THE United States and Canada have shipped 883,975 barrels of apples to England this fall.

THE cotton crop of Texas for 1881 is estimated at 734,450 bales, against 1,040,000 last year.

E. J. BALDWIN is going to plant out 200,000 additional vines this winter in Los Angeles county.

THE borax interests in the Mohave desert appear to be very profitable, and shipments are increasing.

THE paymaster of the United States army don't handle as much money as a section foreman on a new railroad.

AN only sister of Edmund Northrup wishes to learn his address. When last directly heard from he was at Knight's Landing, Cal., in 1867. Address Mrs. Adeline Burnside, Audubon, Iowa.

THE Mayor has signed the order prohibiting the manufacture of gas from crude petroleum within the district bounded by the water front, Larkin, Bay, Devisadero, Ridley, Castro, Sixteenth, Center, Carolina and Channel streets.

THE railroad track from Newark to Centerville has been graveled, and will soon be in condition for use. The Bay & Coast Telegraph Co. will shortly put up their wire connecting the two towns, and establish an office at the latter place.

A MILLERTON correspondent of the Fresno *Expositor* relates an attempt at suicide by a crippled dog in that place, who deliberately leaped from a window in the old court house to the pavement, fully 20 ft. below. The fall did not disable him, however.

ON Wednesday of last week Mrs. Louisa Rodriguez, who lives on the road from Washington Corners to Alvarado, was bitten on the cheek by a spider. The spot continued to swell and enlarge its area until the head, neck and adjacent parts were involved, and resulted in death last Monday.

THE Garfield Relic Bureau, Cleveland, is now prepared to select small *facsimilies* of the beautiful shields which ornamented the corner of the catafalque, and easels, fans, canes, brackets, frames, watch-holders, and various other ornamental designs, made from the wood of the pavilion. The receipts, beyond the cost of manufacture, will be given to the Monument Fund.

PIONEER TIMES IN CALIFORNIA.—Sketches of the "olden time" in California are exceedingly interesting, both to those who survive their participation in them, and to the junior race of citizens who can count their California years on their fingers. The latest contribution to pioneer literature is a book entitled "A Picture of Pioneer Times in California, by Wm. Gray, and is offered for sale by A. Roman, agent, 120 Sutter street, S. F. This work treats of pioneer life in California, more particularly in San Francisco and the coast towns and cities, including the old Missions and Spanish settlements, and treating upon California life up to the time of our late civil war. This book is respectfully dedicated to the boys and girls born on the Pacific slope, of pioneer parents. Its object is to draw a correct and faithful picture of pioneer times in California and thus expose the misstatements of itinerant lecturers and thoughtless or vicious writers, who seem to delight in wholesale misrepresentations of the habits and character of the first American settlers of this coast. The time has come when this matter should be discussed and set right. The pioneers are fast passing away, and in a few short years, not one will be left to contradict and expose the slanderous charges now constantly put forth against them. The book is published in inviting style, and will undoubtedly have wide sale.

THE Chrysolite mining company has declared a dividend of 50c per share, amounting to $100,000, payable at New York on the 10th December. This is the 11th dividend, and the total is $1,600,000.

The diamond drill at the Yellow Jacket is still finding low-grade ore.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

ANNUAL STATISTICIAN OF 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 816 California st. Price, $4.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

DEWEY & CO., Publishers.
No. 252 Market St., San Francisco, Cal.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman, and the Fraternal Record, are now favorably situated at No. 252 Market St. Elevator entrance, *No. 12 Front St., S. F.*

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—San Mateo and Santa Clara counties.
C. E. WETMORE—Alameda county.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
Press, Box 2361, S. F.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F.D., at this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

BOOKSELLERS, STATIONERS, ETC.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and stationery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their first quality of blank book and fine stationery line of goods.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

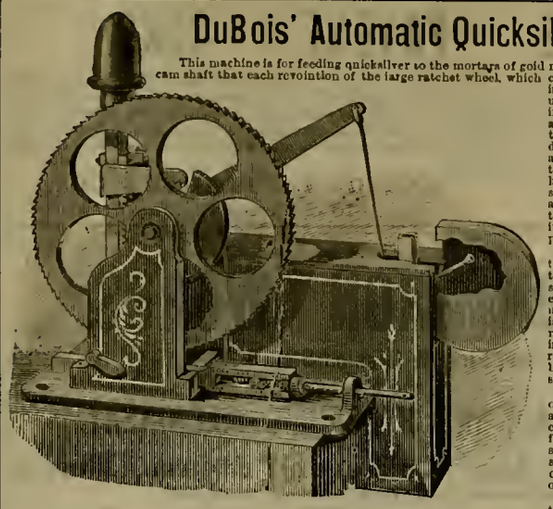
Civil and Mining Engineer.

Formerly of Columbia College School of Mines, now of Colo State School of Mines, will examine, survey and report on pr operty or methods. Box 409 Golden, Col.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; i. e., from every one to four minutes.

It places the feeding of a quantity of quicksilver proper for taking up *all* the gold in the ore, under the control and knowledge of the Superintendent alone, and that with but a few moments of his attention each day. The reservoir of the machine holds 25 lbs. of mercury—a quantity sufficient for some weeks' work. A lid fastening on top of the tank keeps all secure. The cup which throws out the mercury can be replaced by a larger or smaller one, as the ore requires more or less mercury. Several sizes of cups go with each machine.

Price, complete, $100.

At a meeting of the Board of Directors of the above named Company, held this day, dividend No. 35, of Seventy-five Cents (75 cents) per share was declared, payable on Monday, December 12, 1881, at the office in this city, or at the The Farmers' Loan and Trust Company in New York. WM. WILLIS, Sec'y.

Office—Room No. 20, Nevada Block, No. 309 Montgomery St., San Francisco, Cal.

EXTRA DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company,

SAN FRANCISCO, CAL., DECEMBER 2, 1881.

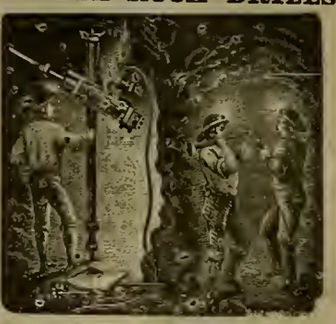
At a meeting of the Board of Directors of the above named Company, held this day, dividend No. 36, of Seventy-five Cents (75 cents) per share was declared, payable on Monday, December 12, 1881, at the office in this city, or at The Farmers' Loan and Trust Company in New York. WM. WILLIS, Sec'y.

Office—Room No. 20, Nevada Block, No. 309 Montgomery St., San Francisco, Cal.

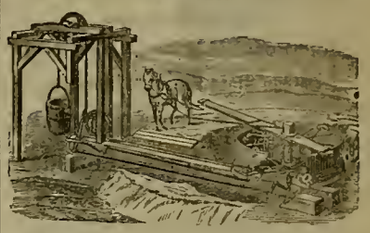
Inventors L. PETERSON MODEL MAKER.

Models for the patent office in wood or metal, a specialty. No. 328 Bush St., between Montgomery and Kearny, up stairs, S. F. Experimental machinery and all kinds of tin, copper and brass work.

INGERSOLL
ECLIPSE ROCK DRILLS

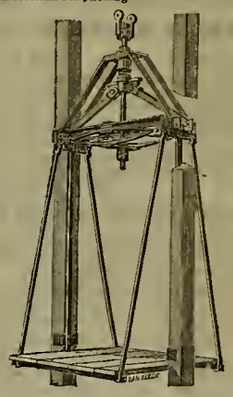


The Most Economical Air Compressore in the Market.



MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing



SOLE AGENTS FOR

BROWN'S PATENT SAFETY CAGE.

REYNOLDS & RIX,

49 Fremont St., S. F.

The Undersigned are Agents for, and are Prepared to Furnish Prices and all Particulars for

THE BALDWIN LOCOMOTIVES, every style and for any service.

THE BALDWIN STEAM MOTOR for use on City and Suburban Roads.

FREIGHT CARS, PASSENGER CARS, STREET CARS, } From BILLEMEYER & SMALL CO., and J. M. JONES & CO.

CAR WHEELS, from A. Whitney & Sons.

SAN FRANCISCO, SATURDAY, DECEMBER 10, 1881.

VOLUME XLIII Number 24

The Harris Dry Gold Separator.

The Harris tubular iron dry gold separator is a machine, as its name indicates, intended to work placer or gold-bearing earth where there is no water. The machine screens and elevates the earth, throws away the dross and saves the gold, with two currents of air, no water or quicksilver being used.

After experimenting with this machine for some months, it was sent to Arizona, and there tried, the inventor tells us, with success, saving the gold and doing more than one-half more work than other machines of the class. The old Mexican plan of working dry placers is very crude. It consists in winnowing or throwing the earth up and down on a rawhide in the wind, the nuggets being saved. Of course this will only do with coarse gold. Modern invention has elaborated this crude idea, however, in such a way that earth containing fine particles of gold can be utilized, and not only the nuggets, but the finer gold be saved.

The Harris machine is so constructed as to have two currents of air, one to agitate the material, and the other to carry off the dross while the gold is being separated. The machine has a good solid frame made of tubular iron, and can be readily taken apart for transportation, and put together without the use of tools. The dry earth, sand or gravel is then thrown up on a series of screens, and falling through on an endless belt or elevator, is thrown up into the hopper, and falling from the hopper to the riffle-board, it passes through the current of air from behind the hopper, falls on the adjustable riffle-board under which a pulsating intermittent current agitates the earth that has fallen there, and carries on a process of concentration, the finer particles of dirt and dust being thrown away by the current behind before falling on the riffle-bed; screenings that contain gold may fall into a crusher or be carried off behind the machine. Riffles are placed at suitable distances on the riffle-board, and behind those the gold is saved. The adjustable riffle-board is constructed so as to save the finest of gold.

The difficulty with most of the dry washers is a tendency of the dirt to pack. In this the finest of the dust is thrown away before reaching the riffle-board, so there is, of course, no chance for that to pack. Neither water nor quicksilver are necessary to work dirt with this machine. They are made of tubular iron, with no cogs or cast-iron to wear out or break. Capacity, twenty to forty tons per day of ten hours, according to the nature of the material and the size of the machine. Weight, from 150 to 350 pounds. Price, $150 to $250; larger or smaller ones in proportion; they may be run either by hand, steam or horse-power. Mr. Harris, the inventor and manufacturer, 308 Mission street, in this city, has a number of testimonials from those using this machine, which may be seen by those interested.

MECHANICAL LECTURES.—The lectures to young mechanics and apprentices, now being delivered at Capt. McNevin's nautical school, and of which we are weekly presenting full reports, are very useful and are attracting good audiences. In addition to this, after the lecture, a discussion, in the nature of a debate, sometimes takes place. We give this week a portion of the lecture given by Capt. Phillips, superintending engineer of the Oregon Railway & Navigation company, and Harbor Commissioner.

G. W. GRAYSON, the prominent mining operator, and a leading owner of the Day mine, Bristol, Nev., has had a town named after him, which is located about a mile below Royal City. The four new furnaces of the Day Co. are to be erected at Grayson, as they will save large amounts in hauling ore and in price of charcoal. The water is brought eight miles. The furnace at Bristol will be kept running till the new works are ready.

Academy of Sciences.

At the regular semi-monthly meeting of the Academy of Sciences, Prof. Davidson presided for the first time in some months. Quite a number of candidates for membership were proposed, but will not be balloted for until the annual election, no members being elected in the month preceding that.

A number of reptiles and insects from Arizona were donated to the Museum. Ivan Petroff presented a wooden mask of the Ongalentze Indians, used in dances in memory of deceased persons. Among other things, W. F. McAllister presented a skull from Tombstone district, Arizona, said to have been found many feet below the surface in one of the shafts. B. B. Redding donated a Shoshone knife or spearhead from Paradise valley. Capt. C. L. Hooper of the U. S. revenue steamship *Corwin*, presented a pair of emperor geese, shot on the Yukon river, Alaska, and a pair of moose horns from the same locality.

E. F. Gerald donated a piece of vanadinite or vanadate of lead from a mine 45 miles above Yuma, on the Colorado. This mineral was first discovered at Zimpam, in Mexico, by Del Rio, in 1801. It has since been obtained also in the old workings at Wanlockhead, Dumfreshire. Vanadium is a rare mineral. It is found in vanadate of lead and vanadate of copper, and also combined with lime. The crystals are beautiful in color and form, looking like shade of coral.

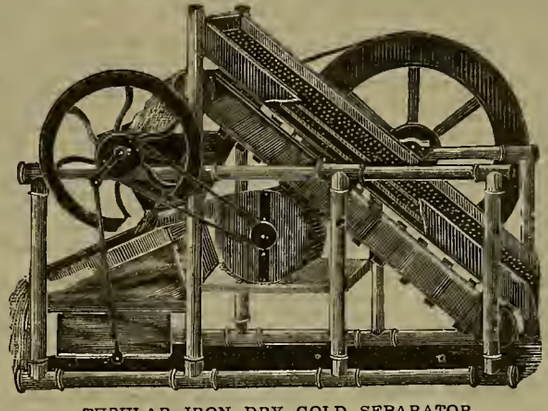
The Grate Elevated.

G. G. Lemmon read a paper describing a new species of Gentian, which he named *Gentiana microcalyx*, Lemmon. This description we shall publish in a future number of the PRESS.

R. E. C. Stearns read a paper "On the Growth of Certain California Forest Trees and Meteorological Data Suggested Thereby." This paper brought out considerable discussion, as the point was advanced that some connection could be traced between the rings, denoting growth and the dry years. Prof. Davidson and Messrs. Behr, Kellogg, Brooks and Stearns all spoke on the subject, it being generally conceded that while some law did exist, proving the relation between the ring growths and the climatic influences, it would be difficult to show the connection. Mr. Stearns' paper, being drawn up from meager data, was simply offered as suggestive of further research in that direction.

Poisoned in Preparing Specimens.

Charles G. Yale, Secretary of the Academy, read a tribute to the memory of Henry Chapman, naturalist, deceased, and offered resolutions of respect, which were adopted. Mr. Chapman was one of the pioneer members of the Academy, and Curator of the department of birds and mammals for several years. He was an enthusiastic collector of natural history specimens, and did a large amount of gratuitous work in preparing various specimens in the Academy's collection. Prof. Davidson, Mr. Redding, Mr. Stearns, Dr. Kellogg and Mr. Harford all spoke feelingly of the merits of the deceased and of the loss entailed on the association by his death. The Secretary stated in his remarks that Mr. Chapman's long life of unparalleled industry was brought to a close by devotion to his chosen pursuits. A skilled taxidermist, he so devoted himself to his business from his love of it, rather than from gain, that he was slowly poisoned by the arsenic used in the preservative powder used in preparing specimens. Once before his blood was poisoned by absorption of these substances, but the warning was unheeded. He was, in his work, in a constant atmosphere of arsenical vapors or powder, which was slowly absorbed into the system with a fatal result.

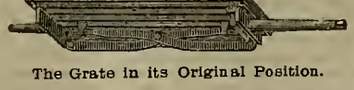


TUBULAR IRON DRY GOLD SEPARATOR.

An Adjustable Grate.

The Adjustable Grate Manufacturing Company, of 123 California street, is one of the new industries of this city. It was formed to manufacture the peculiar form of grate shown on this page.

The object of this grate is to raise the fire at will by means of the shaker, from its original position to any desired hight, and by this save both fuel and time. The grate can be placed in any range now in use, and requires neither alterations in the stove nor skilled labor to insert it, as the adjustable grate will fit in exactly the same place where the stationary grate was taken out. For convenience, economy, broiling, heating flatirons, and quick baking, this invention is very useful; besides, it is a preventive against the settling of clinkers on the sides of the bricks.



The Grate in its Original Position.

The construction is simple, and the heat will not, therefore, affect it, so the grate will last as long as the stove. When people want to put the grate into a stove already made, it is necessary to give the name and number of the range, and state whether it has a water-back or not.

WE see by the Pioche *Record*, that considerable iron ore is being hauled from Short & McDougall's mine at Stampede to the smelter at Bullionville. This ore is sold on the dump at the mine for $5 per ton, and the smelting company pay $5 50 per ton for hauling it to the furnace. Short & McDougall will ship in the neighborhood of 300 tons of ore this month.

Transmission and Storage of Power.

Since the discovery of the Faure battery, in which electrical energy may be stored up, the possibilities of the transmission and storage of power have become much enlarged. As yet, however, nothing much has been done in this direction, though no less an authority than Sir William Thompson considers it unquestionably possible to transmit the power of waterfalls by means of conducting wires to distant stations, so as to use it, perhaps, at 100 miles from its source. The attention which Faure's battery has recently excited is likely to lead to valuable practical results in this direction. Sir W. Thompson suggests that by means of a huge battery on this principle it would be possible to draw off a continuous supply of power from the electric main, and then to distribute it in small and manageable quantities to factories or shops or even private dwellings, where it might be used to drive lathes, or to work sewing machines, or to produce the electric light or, in fine, to perform any service of which electricity is capable. It seems likely that the storage of electricity will not only open up a splendid future for the application of this potent power, but will render it possible to utilize some of the natural sources of energy which have, hitherto, been unmanageable, and have consequently run to waste.

In this way they may yet utilize the power of Niagara. We, on this coast, could utilize some of our mountain streams in the same way. Constant experiment is being made to thoroughly perfect the system, the principle of which M. Faure has proved to be practicable.

A NEW MINING CAMP.—A great deal of prospecting is being done and not a few valuable discoveries are being made at various points to the eastward within range of the Carson and Colorado railroad. The Lyon county *Times* says: A new district, called Crabb district, after its discoverer, S. Y. Crabb, is now attracting the attention of prospectors. It is situated on the old Wellington and Aurora toll-road, nine miles east of what is known as the East Fork bridge, over Walker river. Some very good ore has been discovered, and a number of houses have already been put up to accommodate the workmen. The district is in a heavily timbered and well-watered country. An eight-mile haul, all down hill, will take the ore to the river, where grading for a mill has been commenced, just above the Rose stock ranch. a great many locations have been made, and there is considerable excitement in Mason valley and that neighborhood over the prospects.

A COLORADO paper having asserted that a mine which had paid 20 consecutive dividends of $25,000 each, thereby showing the finest record of any mine in the country, the Tombstone *Epitaph* reminds it that the product of the boasted mine is just one-half the amount paid by the Tombstone M. & M. Co. in the same period of time, and they have three good mines and seven fine prospects left; that it is just a little over one-third of what the Contention mine has paid in a like period, with reservoir to draw many times that, and that two mines on the Comstock paid over four times as much per month as the Colorado mine paid in 20.

COPPER PRODUCTION OF THE UNITED STATES. The final census report upon the production of copper in the United States east of the 100th meridian during the census year ended June 1, 1880, shows that 32 mines put out 1,005,955 tons of ore, or 50,655,140 lbs. of ingot copper, valued at $8,842,961, on a capital of $31,675,096, employing 6,116 hands. Maryland is credited with one mine in Carroll county which produced 164,640 lbs. of copper worth $1,200. North Carolina produced 1,640,000 lbs. of metal.

C. P. HUNTINGTON, in behalf of the Central Pacific railroad, has signed a contract with Wm. Cramp & Sons to build a large iron steamship of 5,500 tons, for the Pacific coast and freight trade. The vessel is to be 350 ft. in length. Another steamer will be contracted for in a few days.

The Debris Problem.

The State Mineralogist's Opinion.

An *Examiner* reportsr, who interviewed Mr. Henry G. Hanks, State Mineralogist, elicited from him the following statement:

In the mines I found a prosperous, industrious and intelligent body of men, who, after planning engineering and mechanical works of great magnitude, requiring the expenditure of years of patient and persistent labor and the outlay of immense capital, were just beginning to reap the results of their labors. I saw men, superior in every way to the same class in any other country, working industriously to support their families, and educating their children to be good citizens of a noble State. Besides the happy homes of the miners, I found merchants thriving while supplying the mines and miners with indispensable requisites; mechanics plying their various trades and callings; school teachers filling the responsible and important position of imparting wisdom and education to bright, intelligent and healthy children; saw mills cutting timber for flumes, lumber and boards for dwelling houses and stores, all running to their fullest capacity; teamsters hauling heavy loads of general merchandise and machinery to the mountains, their wagons loaded with goods, presumably purchased directly or indirectly in San Francisco. All this visible prosperity was the result of the successful working of the mines, a large proportion of which are hydraulic.

On making inquiry I found that much of the capital employed had been invested by foreigners, who, placing faith in both the State and the General Government, from whom the land had been purchased at a double price—land which had been set aside from the agricultural lands and sold expressly for mining purposes—believing that the United States Government would act fair by them, they had bought the mining lands in good faith, and had joined our own people in the investment of millions of dollars of capital, knowing that many years must pass before it was possible to receive any return on the capital. They had brought water from lakes and streams many miles distant; had employed miners for years in driving bedrock tunnels through which the waste matter could be discharged; had expended these large sums in the preliminary work necessary for the success of this class of mining; and at the time of my visit they were receiving back part of the capital invested, and began to have hopes of seeing the current turn, and to realize on the long investment. If it was a mistake and unfair to sell these mines to them, it is certainly no fault of theirs.

From this scene of prosperity I came down to the plains, noticing as I followed the course of the rivers that the debris of the mines had filled their beds to an extent I did not have time to investigate.

On reaching Marysville I found business depressed and a general gloom over the whole community, and not without a cause; for I saw extensive and costly levees, which they had been compelled to raise to protect their homes from the encroaching waters. I was told that the citizens had been taxed 6% on their property to build these levees. I was shown where the river bed had been filled up in front of the city nearly to the cross-timbers of the long bridge. I was driven to Yuba City and down the banks of the Feather river, and shown the extensive earthworks required to save the lands from inundation. I was taken to a point where, last winter, in a fearful storm of wind and rain, the citizens turned out and fought the waters with bags of sand and shovels, plied by the strong hands of those who fought for the preservation of their homes. I was told that the evil was unbearable, and that if the town could not be relieved the citizens must desert their homes and seek others elsewhere. All the trouble was charged directly to the hydraulic mines, and injunctions had been served to stop their work. This the miners well knew, and I found them deploring what, if carried out to the bitter end, would take the bread out of their children's mouths and bring about the same stagnation in the mines that the farmers complain of in the valleys; and the parallel would be about the same, except that the farmers are in personal danger from the effects of the threatened overflows.

During my stay in the mining districts I conversed with all classes in every mine or mining town I visited.

Not only did I not hear an unkind or harsh word against the farmers, but the mining population universally expressed sympathy and admitted the hardship of the situation. At the same time they said: "We know no other trade, nor have we other means of support for ourselves and families. We have never intentionally or maliciously injured those who live below us. We have bought our lands as mining lands and we were allowed to work them by common consent, and we never thought we were injuring others until this controversy began. If the mines are stopped, what shall we do? Our winters are severe; must we let our wives and children suffer? Will Marysville and Sacramento help to support us by giving us other employment? Shall we go to San Francisco, already overpopulated and overstocked with unskilled laborers, and become idlers and non-producers?"

When I heard both sides of this most momentous and serious question, I was impressed with the thought that there was a matter which should be better understood by the people at large; that it should be made a State question, and that the people should accept as such, giving it their immediate, earnest and dispassionate consideration. The miners are uninjured if allowed to continue their work; but Marysville, the low and certain valley towns, are in great danger. If the statements made to me are not exaggerated, there is danger of a calamity in which life as well as property is threatened.

There is certainly no reason why Marysville or any other specific locality should be compelled to pay for all the work necessary to protect themselves from forces other than natural ones, and the people at these points are wholly unable to do so. They have arrived at a crisis where they must be helped, or go to the wall; and help must be extended to them at once, or it will be too late. The public do not understand this important subject sufficiently to realize the magnitude of the interests involved. The majority of the inhabitants of the State know or care very little about it. It is too often the fault of the people, even in republics, to neglect questions of public welfare, and to remain in ignorance of matters of the greatest State interest.

Hydraulic mining is comparatively short-lived, and the gold placers, which are not as extensive as generally supposed, must soon be worked out; while agriculture is eternal. It is a mistake to suppose that all the mountains can or will be washed into the valleys. The mines must in time yield to the advance of population, but mining cannot be stopped with a turn of the wrist or the dropping of a hat. Hydraulic mining is only possible in a new country. The richest hydraulic mine in the world would remain unworked if discovered in an old settled country, because those who had already acquired rights would not permit their lands to be injured by the debris. But in California the case is different. Mining rights were acquired before agriculture was thought of. These rights are not only in the hands of our people, but have been sold to foreigners, who have invested their capital in good faith, and who expect protection. On the other hand, if it can be proved that the rivers and harbors are being filled up and destroyed, and that there is no other remedy, it is clear that the placer and hydraulic mining must yield to the inevitable and stop. But even in that case, if possible, time should be given to the miners during which they could withdraw their capital and turn their attention to other pursuits. It is not going to do any good to get angry or to bear malice. The issue cannot be evaded by quibbles, but must be squarely met. It must be settled eventually in accordance with the equities of the case. But in the meantime the inhabitants of certain cities and localities must be protected, for the matter can be delayed no longer. To them delay is destruction, and perhaps death. The entire question should be referred to the best minds among us for solution, and that the matter be better understood, the best writers and thinkers should be encouraged to study the subject and to freely express their opinions through the medium of the public press. As the nation is wiser and better than the individual, so the opinions of the many are more valuable than those of the few. "Where no counsel is the people fall, but in the multitude of counselors there is safety."

Slow Combustion in Mines.

The combustion which some time ago occurred in the lower levels of the old bonanza mines appears to have never been well understood. It caused the evolution of a vast quantity of deadly gas, which spread through the lower levels of the mine and everywhere drove back the workmen; yet no fire was ever seen, nor could any one think of any means by which fire could have been communicated to the timbers in the old deserted stopes, whence the gas appeared to proceed. From the first, says the Virginia *Enterprise*, the officers of the mines were quite confident that the gas was produced by some kind of slow spontaneous combustion that was going on without either flame or fire. Indeed the gas, where most dense, would instantly extinguish a lighted candle.

As no man could live in the gas, of course no one was able to visit the seat of the combustion to see what was there going on. The opinion of those in the mines was that heat and combustion were generated in masses of timbers under great pressure, and that could one visit the spot he would find that the timbers were being charred by means of a kind of slow, black combustion—that is, that there would be no visible fire.

It was thought what was going on was somewhat of the nature of that which has taken place in the formation of beds of coal; that through great pressure a sufficient amount of heat was generated to drive great quantities of the more volatile gases out of the timbers, soften them and unite them in a solid mass resembling a stratum of coal. We have accounts of something of the same kind having occurred in mines in Europe where the conditions were far less favorable to such a result than here in the bonanza mines.

As the gas now appears to have almost ceased to be produced it is probable that in a few months our miners will be able to make explorations and seek out and examine the scene of the combustion. Such an exploration would be sure to afford matter of interest to the scientific world, and the coal, or whatever material was left behind when the combustion ceased, would be worthy of close inspection.

New Mining Machine.

The following description of a new mining machine which has been working at Snake river we take from the Blackfoot *Register:*

About three weeks ago Mr. J. R. Boyce of Omaha came to Blackfoot in charge of a machine which had been shipped to this point for the purpose of making some experiments in saving the gold from the gravel beds along Snake river. The machine was constructed in Omaha, and is patented by Messrs. Woodman and Seifkins of that city.

It is a well-known fact that the saving of the gold from the gravel beds along Snake river requires a different process than in most any other locality; at least, appliances that will work well in other places and save all the gold will not pay for mining in these beds, while an appliance that will work here will pay in almost any other place. This machine is certainly different from anything we have ever seen before, and had we not been informed as to what it was to be used for would hardly have guessed it. Its appearance is something like an immense wagon, being set on low wheels, and consists of a large wrought-iron tank, fourteen feet in length and five in width by about two in height, the bottom of which is shaped like the letter W. Above one end of this tank is a large cylinder, four feet in diameter, the length corresponding with the width of the tank. The surface is constructed of steel one-fourth of an inch thick, which is perforated, the perforation being about one-fourth of an inch wide by two inches long. About four inches outside of this is a heavy wire screen, made from No. 9 wire, and eight meshes to the inch. On the side of the steel surface is a flange placed in the shape of a screw. The gravel is thrown into this cylinder, which by revolving forces the fine sand through the meshes, while the screw-flange carries all the coarse gravel out of the opposite end of the cylinder. As the fine gravel and sand falls through the screen it drops into the tank, the bottom of which, as before stated, is like a letter W, or two V's. At the bottom of each V is a two-inch iron pipe, in each of which are 19 jets placed alternately at an angle of 10° from the center. Immediately above these pipes is a shaft running the entire length of the tank, to which are attached small paddles like the wheel of a screw propeller. The bottom and sides of the tank are lined with prepared copper plates, the plates being pressed into grooves similar to an old-fashioned washboard, there being 120 ft. surface of plates. The water is forced through the pipes with a considerable pressure; this, with the revolving screw above, keeps the water with which the tank is soon filled in constant agitation; every particle of gold is consequently almost sure to strike the plates. The water is drawn off at the top of the tank, while the fine sand and gravel, as it is forced along to the opposite end, is lifted out by a revolving wheel to which buckets are attached. It is estimated that 10 tons per hour can easily be run through the machine successfully.

When Mr. Boyce arrived here he expected to be able to use the water from the mining ditch of Judge Warrens, but the water had been shut off preparatory to enlarging the ditch. He was consequently obliged to place it in a little hollow, about half a mile from town, where the water from the small ditch running west of the town could be used. He constructed a small flume to conduct the water about 20 rods, and when secured had scarcely eight feet fall, which was hardly a sufficient force to cause the jets to discharge as intended. The gravel was also only a loose wash, and many doubted that he would find any gold at all. About 50 tons was washed, which fully demonstrated that the machine is a complete success, and showed where any improvements could be made in its construction, which was all that was desired by Mr. Boyce. Owing to the insufficient force of water, a considerable amount of sand collected in the bottom of the machine, which with a strong force can be avoided. About $5 worth of gold was taken from the plates, and from experiments made it is estimated that from $30 to $40 is contained in about two bushels of the sand which collected in the bottom. The tailings have been experimented upon, and not a color could be found, thus fully demonstrating that not a particle of gold passed out of the machine.

Mr. Boyce has returned to Omaha, well satisfied with his experiment, and will superintend the construction of machines, making any improvements that may be required, and next season we may expect to see a number of them working along Snake river.

EUREKA HOSE.—This seamless cotton hose is made in several sizes. Though it may be soaked every time it is used, having no outside covering to imprison the moisture, it will, if given a fair chance, immediately dry. Climatic influences do not affect cotton, and therefore it is particularly well adapted for use in hot countries. It can be put away for years and when called suddenly into use in case of fire, is not liable to burst.

THE Silver State learns from Supt. C. D. Rhodes, of the Humboldt Sulphur Co., that they continue to ship on an average, 100 tons of refined sulphur monthly. The mine is looking as well as it has at any time for a year or more past. About the 20th of this month the works will shut down until February, as the roads are getting bad, and it is difficult to get the sulphur to the railroad in mid-winter.

Mining Resources of Fresno.

The mineralogy of Fresno county is at present but indifferently understood. The development of the mines of Fresno county has been retarded for two reasons. The influx of immigration mostly brings those skilled in agricultural pursuits, and totally unacquainted with the arduous vocation of separating the precious metal from its spurious accompaniments. The mineral resources of Fresno county have not been thoroughly prospected. It seems to have been the sole desire and absolute aim to ascend the mountains far beyond the possibility of roads or even decent trails, and there worry out their days discovering rich lodes and veins of gold and silver that a mint of money could not develop nor thoroughly prospect. By this means the more accessible precious deposits are overlooked. The amount of gold that the San Joaquin has in the past 20 years yielded up to circulation is beyond conception. Did this gold hatch like fish from the spawn in the bed of the stream? That the region through which the river passes just before its entrance to the valley has been the chief contributor of gold is proof positive that the richer lodes and veins are far from being at the summit. Yet the prospector wends his way over this very region, while his horse's hoofs, unconsciously to the rider, hammer better ore than the greatest expectations of the rider covet. It is safe to say that the source of the introduction of gold into the San Joaquin has never been intelligently explored. That the very richest lodes exist, and will some day be discovered in this auriferous region, is plainly to be seen. There is only one river mine of importance beyond the adobe (15 miles east of Millerton), and that is of recent discovery. Messrs. Bliss of Santa Cruz, Noyes, Sivils and others of Fresno Flats, have been attempting to prospect a river claim about 20 miles east of Fresno Flats, on the north fork of the San Joaquin. My last information was that the mine was paying one cent to the pan. This was surface dirt, however, it being many feet to the ledge, where they expect to reap a rich harvest. A man can make good wages working cent dirt. An experienced hand can wash 1,000 pans per day, which brings him in $10. There is a magnificent slate range lying on the north side of the San Joaquin and west of the confluence of Fine Gold gulch with the river, that has never been thoroughly prospected, and which presents a splendid field of search and discovery. The Folsom company, who have been mining in the river since July, suspended work during the recent inclement weather, reporting a small dividend.—*Corr. Fresno Expositor.*

THE BRUNT OF THE BATTLE.—It is an unhappy mistake that the valley people make when they believe the lying lawyers' newspapers that tell them they are simply engaged in fighting with great corporations when they press the debris suits. It is really the laboring classes in the mountains who are most grievously hurt by the attacks. The wealthy owners of the mines are heavily taxed, to be sure, but still they will not be impoverished as a result of the conflict. The class who bear the brunt of this battle are the workers, the men with large families and small purses who earn their bread by the sweat of their brows; the merchants who supply the community with wares; the small mine and other property-owners who see their properties being daily reduced in value as an outcome of all this turmoil. These are the ones who sue most earnestly for compromise and who dread most the consequences if the grangers refuse to listen to the voice of peace. This is why the men, women and children of Nevada county, without an exception, have arrayed themselves on the side of the hydraulic miners, and will stay with them till victory comes. It was, it is, it will continue to be, the peoples' fight, so far as the mountains are concerned, for they have the greatest interests at stake. They know their rights, and what is more, they will protect them by every honorable means lying within their reach.—*Nevada Transcript.*

HOISTING CABLES.—Not all the steel-wire hoisting cables in use on the Comstock are manufactured in the East. Some of the best cables now in use here are made at our mines. The steel wire is brought from the Atlantic States, and the cables are constructed here on the lode. At the C. & C. shaft, we a few days since saw in process of construction, a first-class steel wire cable 2,700 ft. in length. As they themselves and their friends were liable to be lowered and hoisted on the cable, it may be guessed that no part of the work of constructing it was neglected, yet two men were able to weave 60 ft. per day. In the East, different persons might slight splices and other parts of the work, but it is safe to say that nothing is slighted at the mines. A man is not likely to slight a thing on which the integrity of his neck may soon depend.—*Virginia Enterprise.*

SAYS the Gold Hill *News:* The work now being done on the Comstock is absolutely necessary to the development of the mines. The mines are just ready for this work to be done, and it can be done cheaper in winter because of the cooler condition of the lower levels and the consequent better progress that can be made by the workmen.

ACCORDING to the *Daily American Exchange*, of New York, J. W. Gashwiler, of San Francisco, has bonded the Idaho mine, of Grass Valley, for the Paris (France) mining market.

MECHANICAL PROGRESS.

Injudicious Use of Lubricants.

There ore probobly more dollars wasted in the improper nse of lubricants as applisd to mochinory than in any othsr articls in tho supply line. Aa a rnlc, tho proprietor of a shop or monufactory buys tho cheapeat oil ho can get, regardless of the quantity it takes to prevent ths machiuery from refusing altogethsr to be set in motion. If a supply dealer goes to snch o person with a first class oil and attempts to demonstrate its good qnalities, on ioquiry is ot once raised in regard to price: "How much a gallon?" Good oil cannot be sold at as low a price as the stuff he is now nsing, so ths reply is, "don't want it; tho price is too high. Our oil costs na but 50 cts. a gallon, and givss entire satisfaction." Tho fact is, in most cases, he does not know whot the oil costs him, and only recognizss tho prics per gallon. Ho does not consider the fact that double ths quantity of poor oil is required; neither doss he consider that the weor and tear of his machinery is more thon double in consequence of nsing a poor lubricaot. The mochines havs to run with looss boxes, therefors, ths quality of work produced is inferior. If with ths boxes properly tightened, and on machiocs were tho hoxes are not odjostabls, the attempt is mode to use poor oil, the first indication the workman has that something is wrong is, ths machine coming to a dead stop, and requiring to be dosed with korosene oil ond taken apart before it can bs used again. With poor oil, as it is easy to see, much more power is required to drive ths machinery than if good oil was nssd; therefore more coal has to be consumed to supply the nccessary power to drive the engine. The helts ars overstrained, ood a less quantity of work is turned out. Ths proprietor, in the office, sees only so much monsy paid out for oil. He seems only to consider that it is all oil, and that oil is nsed for lubrication; therefore, he dctermioes to have the cheapest. If he would walk about his shop, and examioe into ths truth of the facts herein atated, he would be immensely astonished.

We visited a shop a fsw days since and saw ths eogineer runuing a 2"x7' engine ahout 400 revolutions per minute, nsing tallow, at the rate of half a gill svery 15 mioutes. He said that ths cup would not feed fast enough, so the proprietor, instead of huying a larger cup to feed a small quantity continuously, allowed his engineer to throw away tallow at an extravagant rate. The best lubricant, judiciously used, is always the cheapest.

For cutting bolts and tapping nuts, it is generally supposed that any cheap oil will aoswer, bnt ths fact is, the best oil is necessary to insure the maintenance of standard sizes and ths durability of taps and dies. Ths first cost of an article is ssldom the sonrce from which to determins its true sconomy.—*American Machinist.*

A New Patent Wood-Screw.

The manufacturs of a new patent wood-screw has been, or is about to he, started in Providence, R. I., which hids fair to give ths woodscrew combination no littls trouhle. This new screw, it is said, presents such meritorious features that it is likely to meet with a rapid sale at once. The company operates under H. A. Harvey's patsnts for rolling screws. Thess aorews ars esnecially adapted for driving into wood with a hammer, and to this end the form of the scrsw varies from that in common nse, the point being conical, without threads, while the hody of the screw is provided with threada at such a pitch that they afford no material reeistance when entering the wood, but are so formed as to hold firmly against any pressure tending to pull them ont. The head, too, is an innovation in screw making; dispensing with the nsnal slot, it has simply a couple of bosses or slots which engage as readily with the screw driver ae the elot, and yet does not detract from the strength of the head as does the former. It is said that these screws can he driven into the hardest wood without either hrcaking the wood or injuring the screw. The machinery for producing them is very ingenious in its construction. Each machine has a capacity for threading 30 to 60 acrews per minute. The company, so the report goes, will turn out 2,500 gross per day of theso new screws, which they propose to sell at auction instead of in the regular way. Whether they expect hy so doing to demoralize the market and compsl the other screw companies to huy them out, or whether they think hy this course they will better introducc their goods caunot he determined.

AN IMPROVEMENT IN WIRE ROPE.—It is well known to mining engineers that the weight of the wire rope used in deep mines is so great that every meane is adopted to lessen it. With that end in view, tho sectione nearer the hoisting cage are often made lighter, the strength of the rope being increased in proportion as it has more of its own weight to carry. A German firm H. Kern & Co., of Gleiwitz, has commenced to manufacture wire, the gange of which grows smaller the longer it is, and from this wire, A. Dsichsel, of Zabrze, is now making hoisting rope, and at the Dusseldorf exhibition showed a length of nearly 900 ft., in which the wires composing the strande were of one piece, though the weight per unit varied.

The Fontaine Locomotive.

Considerablo discussion has arisen, of loto, in regard to the performance of the "Fontaine locomotive," with its two story driving wheels. The first engine of this deacription, after undergoing what wos olaimed to be several satisfactory triols, wos sent to Cansdo and placed in active service, whers the performance, in comparison with a Baldwin locomotivo, was pronounced to hsvs made a remarkably satisfactory showing. Some few weeks since, Fontoine engine, No. 2, was put into regnlar service upon the Pennsylvania road, between New York ood Philadslphia. Various reports hovs come to hond in regard to the performaoce of this engine. One report soys: "Tho Fontains engine is a foilure—it is not suited to the Psonsylvaoia troffic." * * * "Ths sngine has been sant back to its stoblcs—the Patterson shopa." * * * "The Pennsylvania peoplo have had o look ot it and calculated the pressure nn the roils too great, if it is called npon to do anything heyood flying light."

The business managsr of the Fontaino Co. makes emphatic denial that it fails to perform proper duty, and refers to a prominsnt Pennsylvania railroad man as saying that "ths work of ths Fontaine was particularly good." That it had exceeded the performanoe of one of the best sngioes upon the road, and particularly in a loog trip from Altoona to New York, when the run was mode with the use of much lsss watsr thon is usnally requirsd. At latsst dates, however, the trials of the sngino had not besn concludsd.

A recent correspondsnt of the *Scientific American* says: "From the evidencs furnished, it seems to he ahundantly established that the Fontaino locomotive makes a long stride forward io ths dirsction of speed and economy in railway servics."

The paper above quoted in its issue of Nov. 26th, after olluding, at considerahle length, to the adverse comments upon tho performances of the engine, says: "It is sasily possihle that under ths varyiog conditions of railway service, particularly as roads are now mads, the Fontaine locomotivs may not in all respects come up to the expectation of the inventor and his friends; it may not, for instance, accomplish a speed of ninety mils. Nevertheless, what it has already dons, if human testimony is worth anything, justifies ths position taksn hy this paper, that it marks a notahle advauce in locomotive construction, and that—to repeat our own words—"if sxperience shall confirm ths premiss held out by the psrformance of ths engine now on trial," the nsw locomotivs "must materially increase ths sconomy of railway servics." As yst we have seen no adequate reason for donbtiog the probability that the future behavior of the engine will confirm the record it has already made.

Selecting Timbers.

Rankine says that thers are certain appearonces characteristic of good wood to what class sosver it helongs. In the same spscies of wood that specimsn will in geoeral be ths strongest and ths most dnrahle which has grown ths slowsst, as shown hy the uarrowness of the annular rings. The cellular tissus, as seen in ths medullary rays (when visible), should he hard and compact. Ths vascular or fibrous tissue should adhere firmly together, and should show no wooliness at a freshly cut surface; nor should it clog the teeth of ths saw with loose fibers. If ths wood is colorsd, darkness of color is in general a sigu of strsugth aud durahility. The freshly cut surface of the wood shonld be firm and shining, and should have somewhat of a translucent appearance. In wood of a given species, the heavier specimene are in general the stronger and the more lasting. Among resinous woods, those which have the least resin in their pores, and among non-resinous woods, those which have least sap or gum in them, are in general the strongest and most lasting. Timher should be free from such hlemishes as "clefts," or cracks radiating from the center; "cup shakes," or cracks which partially separate one layer from another; "upsets," wherc the fibers have heen crippled hy compression; "wind galls," or wounds in a layer of wood, which have been covered and concealed hy the growth of suhsequent layers over them; and hollow or spongy places in the center or elsewhere, indicating the commencement of decay.

HINTS ABOUT SCREWS.—When screws are driven into soft wood and suhjected to considerahle strain, they are likely to work loose; in such case, dip the screw in thick glue before inaerting. When huying screws, see that the heads are round and well cut; that there are no flaws in the body or thread part, and that they have gimlet points. A screw of good make will drive into oak as easy as othere into pine, and will endure having twice the force brought against it. When there is an article of furniture to he hastily repaired, and no glue is handy, insert a stick a little less in size than the hole for the screw and fill the rest of the cavity with powdered resin; heat the screw sufficiently to meet the resin as it is driven in.

To get a gear wheel off a shaft upon which it has been shrunk, it ie recommended to pour some melted iron around the huh, hy which operation the latter will expand so quickly that there will he no time for the shaft to get hot, and the gear will come off easily.

SCIENTIFIC PROGRESS.

What Volcanoes are Not.

"What is a volcano?" This is a familiar qnestion, often oddrsaed to us in our yonth, which "Catechisma nf Universal Knowledge" ood similar school manuals havo tanght ns to reply to in some such terms as ths following: "A volcano is a burning mountoin, from the summit of which issue smoke ond flames." This description, says Prof. Judd, is not merely incomplete and inadequate as a whole, but eaoh individual proposition of which it is mode up is grossly inadequate and, what is worss, perversely misleading. In tho first plaos, the action which takes plaos at volcanoes is not "hurning," or combustion, and beats, indeed, no relation whotover to that well-known process. Nor aro volcanoes nscessarily "mountains" at all; essntially, they are just the reverss—namsly, holes in the earth'a crust, or outer portion, hy msans of which a communication is kept up hetween the surfaos ond the interior of our globs. When mountains do exist at conters of volcsnic activity, thsy are simply ths heaps of materials thrownout of thess holes, and must, therefors, he regarded not os ths canses but as the consequences of volcanic action. Nsither does this action always take placo at the "summits" of volcanic mountains when such exist, for eruptions occur quito os frsquntly on their sides or at their hase. That, too, which popular fancy regards as "smoks" is really condsnsing steam or watsry vaper, and ths supposed raging "flames" are nothing more than the glowiog light of a mass of melten material reflected from these vapor-clouds.

Ths nams of volcano has been horrowed from ths mountain Vulcano, in ths Lipari islands, where ths ancients bslisved that Hephaestus, or Vulcan, had his forge. Volcanic phenomsna have been at all times regarded with a superstitious awe, which has resulted in ths gensration of such myths as the one just mentioned, or of that in which Etna was said to have been formed by the mountains under which an angry god had huried the rshellious Typhoo. Thess stories changed their form, hut not their essence, under a Christian dispensation, and Vulcano became regarded as the plaos of punishment of ths Arian Emperor Theodosius, and Etna as that of Anne Bolsyn, who had sinned by psrverting the faith of King Henry VIII.—*From "Volcanoes, their Action and Distribution," in Popular Science Monthly.*

CURIOUS EXPERIMENT IN CRYSTALIZATION.—The following experimsnt is given hy Peligot in *La Nature:* Dissolve 150 parts hy weight of hyposulpate of soda in 15 parts of boiling water, and gently pour it into a test tuhs so as to half fill it, keeping the solntion warm hy placiog the glass in hot water. Dissolve 100 parts by wsight of acetats of soda in 15 parts of hot water, and carefully pour it into ths sams glass; the latter will form a laysr on the surface of ths former and will not mix with it. When cool thers will be two supersaturated solutions. If a crystal of hyposulphate of soda hs attachsd to a thrsad and carefully passed into the glass, it will traverse the acetats solution without disturhing it, but on reaching the hyposulphats solution will causs the lattsr to crystalizs at onos in large rhomboidal prisms with ohlique terminal facss. When the lower solution is completely crystalized, a crystal of acetate of soda similarly lowered into the upper solution will cause it to crystalize in ohlique rhomboidal prisms. Ths appearance of two different kinds of crystals will not fail to surprise those not acquainted with such experiments.

SCIENCE IN AGRICULTURE.—The last 20 years have witnessed a great change in the relations hetween science and agriculture. The great improvements in cultivation and farm management are the results of sound reasoning combined with arithmetical calculation, in regard to work on the farm, which rapidly is taking tho place of the old-time "rule of thumh" so closely adhered to hy the unprogressive. In Germany, hetween 100 and 200 chemists and physiologists are smployed in not far from 90 experiment stations and other institutions in studying the perplexing problems of farm science. In every European country, excepting Turkey and Portugal, this work is said to he going on. Neither is America hehind the times. There are various agricultural colleges in the United States and Canads, which devote especial attention to these inquiries, whose work ie supplemented ably hy work in medical colleges and hy private investigation.

STILL ANOTHER COMET.—Director Swift, of the Warner Observatory, has discovered a faint comet in the constellation Cassiopea. It is possihle that the stranger is the comet of 1812, which was expected to appear in the north. The comet is in the line hetween Polaris and the Great Cluster in Pereeus, a little nearer to Polaris. This is the seventh comet discovered since January.

MODIFICATION OF RUHMKORFF'S COIL.—With an induced coil, arranged in two hlocks placed on the poles of the magnetic nucleue and communicating with sach other, so that their points of junction may he at eqnal distances from the nucleus, effects are ohtained of much greater powsr than with the ordinary arrangement.—*Les Mondes.*

THE LATE TRANSIT OF MERCURY.—Ws learn that very successful observations of ths late transit of Meronry were taken at Honolulu. C. H. Rockwell, of Tarrytown, N. Y., the astronomsr who went to Honolulu to observs the transit of Mercury on the 7th nlt., returnsd to this city by the *Zealandia*, ond reports his obsservatioos as having bsen highly successfnl. Ths phenomena of the transits of the infsrior planets, Venus and Mercnry, across ths disk nf the sun aro always looked for with great interest by astronomers as enahling them to test the accuracy of their tohles, and to bring their theories face to face with actuol facts. Ths object of these observations is to learn with increased accuracy the relative distances of the plonets from eseh other aod from the sun, which is technically known os determining the solar parallax. The distance in latituds between two points from which observations of a transit ors mads servos as a hass lins to calculate the diffsrcnes of position between the parallels on which the planet is seen projected on the disk of the sun. The valns of theso observations of Mercury is much less than ths corrsponding observations of Venus, for tho rsason that tho smaller planet is ncarer to the sun than to us, and the long leg of ths triangls is on our side, whereas with Venus ths oooditions are rsversed, the distanco from the sun to tho larger plonst heing abont two and a half times as grsst as our distanos from the plonst, and tho chances of error in observations are dimiuished in this proportion.

A NEW SPECIES OF HORSE.—The *Annals and Magazine of Natural History* for July contains a translation of a Russian paper, in which M. Poliakof hrings forward a mass of evidencs in proof of ths sxistenes of a hitherto unknown species of horss not far from Zaisan, in Cantral Asia. The animal appears to rsssmhle a small domestic horss, of a dun color; its hcad is large in proportion to the sizs of ths animal; and the root of its tail is destitute of long hair for some distance. M. Poliakof names his supposed new species *Equus Przewalskii*, in honor of ths travsler who brought the skin to Russia. He regards it as a trus horse, and rsmarks that "if it were possihls to prove that culture influenced the growth of the tail, and that this hecame mors hairy, and the mons longsr, under altered conditions of life," it might he affirmed that "it was indeed the animal whoss ancestora wers reclaimed by man in the stone period, the so-called domestic horse of our day."

RADIANT MATTER.—Father Serpieri aud Prof. Riglio have published, in the *Revista Scientifico-Industriale*, some of their observations upon Crookes' apparatus. Ferrini has rspeated ths sxperiments and published tho following theory: On account of tho very great resistance which, as Hittorf has shown, is produced under the influence of a great rarefaction around the cathode, there arises a powerful induction, and the phosphorescencs of ths walls of the globs indicates thsir intersection with tho lines of force of the electric field, which is most neatly circumscrihed where those lines are the most snergetic. The gaseous molecules arrange thsmselves along these lines while transmitting electricity. The blus pencil, which corresponds to the most intense portion of ths slectric field, represents a continuous discharge bstwesn the cathods and the glass which is in front of it.—*La Lumiere Electrique.*

DUST EXPLOSIVES.—Dust mixsd with air is a dangerous explosivs. If a largs log of wood were ignitsd it might he a wesk bsfore it would bs entirely consumed. Split it up into cordwood and pils it np loossly and it would hurn in two hours. Split it np into kindling wood, pile it up loosely, and perhaps it would burn in less than an honr. Cut it into shavings and allow a strong wind to throw thom into the air, or in any way keep the chipe comparatively well separated from each other, and the log would perhape he consumed in two or three minntes; or, finally, grind it up into fine dust or powder, hlow it in such a manner that each particle ie eurrounded by air, and it would burn in less than a second.

A CURIOUS FACT.—Dr. Lewis Balch, of Albany, in a review of the medical evidence in the celebrated Billings murder case, alludes to the curious fact that a hall of a given calibre fired through glass may make a hole enough smaller than the full size of the hall hefore firing to prevent an unfired hall of like calibre passing. Dr. Balch notes having seen "a base hall, thrown with great force and having a rotary twist, make a round hole through an ordinary window light, and when the hall was tried to he again passed through the same opening the hole was nearly one-third too small."

IRIDIUM is many times hardsr than the hardest steel, and will not rust or corrode in any atmosphere or fluid. It defies the file and resists all acids. The only means of cutting iridium ie by friction with a soft metal wheel charged with diamond dust or fine corrundum.

THE great Vienna telescope just constructed is now the largest refracting telescope in the world. Its aperture of 20 inches exceeds by one inch that of the Naval observatory instrument at Washington. It is 33 ft. 6 inches long, the mounting is very superior, and the large and impoeing observatory is well located.

SILVER is the most perfect reflecting metal, absorhing less than three per cent. of the rays of light.

Bullion Shipments.

We quote shipments since onr last, and shall be pleased to receive further reports:

Standard Con., Nov. 28th, $65,834; Contention Con., 28th, $14,308; Northern Belle, 28th, $6,866; Star, 28th, $3,713; Hanauer, 29th, 2,160; Enreka, 29th, $1,320; Nevada, 29th, $1,165; Horn Silver, 29th, $7,500; Barbee & Walker, 29th, $1,638; Wood River, Dec. 4th, $2,870; Hanauer, 4th, $2,335; Stormont, 4th, $6,685; Horn Silver, 3d, $20,000; Barbee & Walker, 3d, $1,641; Horn Silver, 2d, $25,000; Wood River, 2d, $2,635; Hanauer, 2, $2,310; Wood River, 1st, $6,655; from Silver Reef district, Utah, for November, $79,639.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

Napoleon M. Co., Dec. 2. Location, Placer Co. Cal Capital stock, $10,000,000. Directors—Alexander Badlam, Alexander Weed, Holland Smith, J. Haley and Thos. P. Hayes.

San Bernardino Lumber and Fluma Co., Dec. 2. Location, San Bernardino, Cal. Capital stock, $1,000,000. Directors—Charles F. Burnham, John T. Bradley, Samuel W. Pratt, Dwight Whitney and Samuel Locke.

Limestone Channel Gravel M. Ca., Dec. 7. Location, Butte Co. Capital stock, $5,000,000. Directors—George W. Lovejoy, D. K. Perkins, James Ireland, Charles E. Corbiere, E. Von Hasslocher.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

The Mining Share Market.

Our stock tables show what the fluctuations in the share market have been. Sales are rather light, though there is some little revival of the interest in many stocks..

Assessments levied by 22 mining companies become delinquent during the current month, the aggregate amount called for being $380,150, the smallest of any monthly aggregate during the year 1881. Of the assessments levied $269,500 is on account of Nevada mines, $80,650 on account of California mines, and $30,000 on account of Arizona mines. During the year 1881 the various mining companies have levied 364 assessments, aggregating $9,385,160.

The usual monthly cash balance statements have been issued, the following being those of the principal companies with cash on hand:

Alta, $15,328.48; Alpha, $693; Argenta, $1,343.21; Bullion, $12,710.43; Bulwer Con., $100,636 74; Benton Con., $18 296 03; Bechtel, $4,048.37; Belcher, $63,853.44; Belle Isle, $922 21; Belding, $903.82; Con. Virginia, $20,327.10; Crown Point, $21,316 17; Chollar, $7,523.98; Challenge, $372.67; Contention, $83,540.92; Exchequer, $13 020; Geo. Jackson, $6,536.34; Justice, $25,877.44; Lady Washington, $2,294 16; Mono, $8,853 48; Mexican, $47,931.56; N. B. Isle, $12 621.97; N. Belle, $66,638 65; Overman, $24 957.60; Occidental, $8,019.92; Ophir, $51,541.67; Standard, $397,085 88; Saratoga, $7,714 94; S. Nevada, $17.605 04; S. Hill, $11,952 46; Utah, $18,940.99.

The following had an indebtedness Dec. 1st: Bodie Con, $8 055 05; Best & Belcher, $9,031 64; Betty O'Neal, $2,018.08; Caledonia, $13,881.46; California, $38,234 00; Day, $69,493.28; Gould & Curry, $12,783.80; Grand Prize, $28,000; Holmes, $1,822.18; Hale & Norcross, $17,479.83; Imperial, $846.90; Independence, $7,261 34; Mt. Diablo, $7,823.65; Potosi, $18,036.81.

The old officers of the Mexican mining company have been re-elected for the ensuing year. The superintendent concludes his annual report with the following: "I will state, as our work during the past year has been almost exclusively devoted to reaching our 2700 and 2900 levels, the work of the coming year will be applied to opening up and exploring those levels. Although nothing of value has yet been exposed, the character and extent of the vein matter already passed through in our drifts and drill holes, and the vast amount of ground yet unexplored, give great encouragement for the development of something of value during the coming year."

Reports from Sweetwater mining district are very encouraging, and there is likely to be a flourishing camp at that point next summer. There are now 20 miners at work in the Summers mine, besides a number of men working on other claims in the district. Many of the claims are showing up good ore. The carpenters are at work on the mill building.

Colorado is expected to produce from $22,000,000 to $25,000,000 in bullion for the year 1881.

Lewis District.

A correspondent of the Virginia *Enterprise*, writing from Lewis, says:

Lewis is situated in the mountains, 18 miles from Battle Mountain. It is not a new camp, the first mill having been built here some nine or ten years ago, but it is only in the last year that any notice has been taken of the place.

There are three towns, Upper, Middle and Lower Lewis. In the upper and middle towns are situated the Star and Grove, Highland Chief, Dahlgreen, Chloride, Morning Star and Eagle mines. These are the principal mines of the district, and are owned and controlled by New York capitalists, represented by G. W. Bothwell, who is Superintendent of the mines and mills. The lower town is where most of the residences are situated, and where the business is done. It has quite a lively appearance at present, owing to a good many men being out of work.

There are two 15-stamp mills here, the Eagle and Star and Grove. The Star and Grove mill is about worn out, and will shortly be turned into a foundry. The Eagle mill works steadily, and has just finished a run on Betty O'Neal ore.

There is also nearly completed a large 40-stamp mill. It is provided with roasters, and is one of the most complete of its kind on the coast. The builders are Messrs. Beckett & McDowell of New York. Their agent is J. P. Courter. The same parties are also grading for a 10-stamp mill for the Dahlgreen company.

Half a mile to the south of the town is located the Betty O'Neal mine. It is the only mine in the camp that is owned by San Francisco parties. The Superintendent is John C. Schmitt, formerly of the Lady Bryan mine, Virginia.

At present the place is somewhat overdone. There are a good many more men here than there is work for, and it is a very good place to stay away from. The wages are $4 per day of 10 hours. The mines are wet and very cold.

Lewis may in the future turn out to be a good place, but it will not be till the management is in the hands of three or four companies. A mining camp can never amount to very much while one company controls everything.

A Quarterly dividend of $2.50 per share, amounting to $135,000, was paid by the Richmond Con. M Co. at London on the 8th of November. This is a Nevada mine, near the Eureka Con. This company has paid $3,502,600 in dividends to date, while the Eureka Con. has paid $4,680,000. The last named suspended dividends in October, 1881, and it will be some months before they are renewed.

The Vizina Con. M Co. of Tombstone produced $213,300 during the three months ending Nov. 1st. It is said that the mine is capable of doing still better than this. The first dividend of $10,000 was paid on the 1st of November.

The Jocuistita Mining Co. has declared its second dividend of $1 per share, amounting to $100,000, payable at New York on the 30th of November. This makes $200,000, and a surplus of $376,000 is carried forward.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

Isabelle.—Mr. Lewis Chalmers, managing director of the Isabella Company, is hard at work at the mines, and has 4 teams on the road hauling rich ore to the mill, which it is expected he will start up in a few days, all the new machinery being in, the mill hands engaged and ready to commence when Mr. Stewart, of the Hunt, Douglas & Stewart process, (which Mr. Chalmers has adopted for the treatment of his ore) has got everything in order for steady work. There is an abundance of ore, we understand, at the mine, to keep the mill running to its full capacity, and if the weather keeps moderate, to permit regular hauling, bullion shipments will be made without interruption.

AMADOR.

Drytown Items.—The Potosi mine under the management of Digory Hobbs, is panning out well, and the 10-stamp mill is kept constantly running. In the Maryland mine they have finished their 400-ft shaft and commenced drifting. The Seaton Con. ore working in the old Seaton tunnel, with good rock in sight. The last crushing of this rock in the old Bonanza mill paid $6.75 per ton. The Co. under the management of D. T. Davies, are erecting a 20-stamp mill on the ground. The Phœnix reduction works of this place, under the management of E. C. Voorbies, of Sutter Creek, resumed operations this week.

CALAVERAS.

Glencoe Items.—Calaveras *Chronicle*, Dec. 3: The Norwich mill has been running steadily since repairs were made. The outlook in the mine is healthy. The Valentine mill stopped to clean up. Rumor has it that its stamps are hung up for an indefinite time. The gist of the matter seam to be that the new owners based their calculations entirely upon supposed average assays of the ore in the mine, but the product of the mill did not correspond. The principal cause of disappointment is beyond doubt, that the mine, after having been gouged by previous owners, had not been developed to insure a fair trial. Work in the mine is going on as usual. The upper tunnel of the Glencoe is still being extended. The ore looks well and is 7 ft wide. No hanging wall in sight. Lewis & Fairchild are still stoping specimen ore. Quite an unusual number of mining operators were cruising around here last week. A number of the Chinamen were given notice to leave this district.

EL DORADO.

The Morey Mine.—*Mountain Democrat*, Dec. 3: Last Thursday O. H. Spencer, one of the proprietors of the Morey mine, near Grizzly flat, came down on his way to San Francisco, bearing with him a sack full of ore recently extracted from that mine. The samples were of good size, ranging from 15 to 25 lbs. in weight; all were streaked with sulphuret seams, showed considerable free gold, and were estimated to be good for at least $15 per ton by ordinary mill process. They were taken from the face of a drift which has been run 15 ft southward on the 104-ft level in the Morey mine. A similar drift is being run to the northward, with encouraging prospects. In the south drift a "horse" was encountered at the outset, which cut out nearly all the quartz, but after drifting about 10 ft they got through it, and now they have about 3½ ft of quartz between the walls, which are about 6 ft apart, and a vein about 25 inches thick, next the east wall, is of the character of the samples brought down by Mr. Spencer. He and his partners are highly elated with their prospects.

Bullion.—Last Thursday evening, escorted by an armed body-guard, Supt. Aldersley brought over the bullion realized from the clean-up made at the Bowlder mine that day. They had made a 20-days' run, had crushed something over 400 tons of rock, which paid handsomely; far beyond their expectations. This crushing came from a body of quartz near the east wall, about 20 ft thick and very rich. There is a large body of it so located that it can be broken down and delivered at the mill at a cost not exceeding 40 cents per ton, which leaves nearly all the product for clear profit. In the Bowlder and Gopher claims there are tens of thousands of tons of ore above the level of the mill and within a few hundred yards of it.

The Benfeldt Mine.—Fred Benfeldt, at his fine gravel mine near Smith's flat, made another clean-up a few days ago. During the run he took out and crushed 2,020 carloads of gravel, from which he realized $4 353, without cleaning up the sluices, in which he estimates that there is not less than $150, and probably $300 or more. He has a very large block of this quality of gravel in sight. The Benfeldt is a very good mine.

INYO.

Defiance Booming.—Bodie *Free Press*, Dec. 4: The Defiance mine at Darwin, of which Mr. P. Reddy is the principal owner, is now working with a force of 25 men. Mr. Reddy once sunk a fortune in this mine, but has never lost confidence in it, and is now going to pull his fortune out of it again.

MARIPOSA.

Coulterville.—Mariposa *Herald*, Dec. 2: Work on the various mines in this vicinity is still progressing. Good developments in this line may soon be expected.

Red Bank.—Mariposa *Gazette*, Dec. 3: The Merced Hydraulic M. Co. have, this week, completed the reservoir and ditch on Flyaway Gulch, which doubles the amount of water formerly had on the Red Bank. The Scott Gulch reservoir and ditch will be completed in a few days. Also the new tail flume, which is 5 ft deeper than it was last year. The work of setting the new pipe and giant has been commenced. With 2 lines of pipe and 2 giants, the 2 past years hydraulicing already in the pits, will be largely added to by this winter's work, which altogether will undoubtedly make a big clean up in the spring. The new pipe amounts to 600 ft in length.

NEVADA.

Shipment of Gold.—Nevada *Transcript*, Dec 3: The total sum of $90,536 was shipped to San Francisco, through Wells, Fargo & Co's. office in this city, during the month of November. Most of this gold was obtained from the quartz mines in this immediate vicinity, and in fact but a small proportion of it came from gravel mines, and not a dollar of it from any mine that has been injuncted. It will be seen that the shipmeuts are decreasing on account of the foolishness on the part of the farmers. The gold that is taken out in the upper part of the county is never added to that which is taken out around here. It passes through Wells, Fargo and Co's office here and is simply checked on the books, the offices in the country receiving credit therefor.

A Ledge of Rich Quartz Struck.—Messrs. L. O. Keith, Sime Johnson and Wm. Irwin are the owners of a quartz claim situated on Little Deer creek, about a half mile from Charannot's house on Canada hill. The claims were located about one year ago from the discovery of a stringer of quartz on the surface which gave favorable indications, and a shaft was put down. A few tons of quartz were taken out, which more than paid expenses, but having worked down to water level, and the owners not being in a financial condition just then to erect hoisting works, further development at the claim was suspended. Last July operations were resumed, hoisting works erected, and an incline sunk to the depth of 100 ft. This occupied until about two weeks ago, when drifts were commenced to be run north and south. Thursday morning the north drift which had been run a distance of 21 ft, struck a quartz ledge about three inches thick, which by sun down had widened out to a strong foot. The quartz is of bluish cast, known as ribbon rock, solid and firm, showing an abundance of free gold, and is heavily

charged with sulphurets. Were the whole body of ore as rich as specimens exhibited us, the rock would average several hundred dollars per ton; but from $30 to $100 per ton is a low estimate to put the yield, at mill process.

Five men have been employed since the work was resumed in running drifts, but it is the intention to double the force of miners and develop the rich body of ore that has just been brought to light. The mine is under the superintendence of Mr. Henry Richards, to whom is due in a great measure the credit of striking the lode at so early a time in running the drifts, by his judgment in locating the pitch and angles of the ledge.

PLACER.

THE IRON CO.—Placer *Argus*, Dec. 3: The California Iron Co.'s works at Hotaling, (which is the postoffice lately established at the new settlement near Clipper Gap), are running on full time, and turning out about 30 tons of very good pig iron per day. The 6 new charcoal furnaces were put into requisition for the first time last Monday. Such occasional temporary stoppages, as that lately reported, where the works were closed down for three days, will be of less frequent occurrence hereafter, it is believed. Supt. White tells us that everything is working well and satisfactorily.

THE LINCOLN COAL MINE.—Placer *Herald*, Dec. 3: The coal mine on the old Cook place near Lincoln, recently purchased by Landes, of Wheatland, has been thoroughly re opened and is being run steadily. Much coal is being taken out, and much of it is of a superior quality. Mr. Gates informs us that he tried some recently in an ordinary cook stove and was surprised at the amount of heat it gave out. In the cities where fuel is high, it would seem that with suitable stoves this coal might be used to great advantage, from an economical standpoint.

THE ROCKY POINT.—The Rocky Point M. Co., whose works are located a few miles above Auburn, on the Middle Fork of the American river, are putting in full time prospecting their claim, working day and night. Some paying gravel has been taken out of this mine, and it is hoped when well opened they will strike it not only rich but extensive.

THE HYDRAULIC ELEVATOR.—The hydraulic elevator in operation on the Middle Fork of the American river, report says, works like a charm, and the gravel which they are washing from the bed of the river is paying equal to the expectation of the proprietors. A means for getting at the gravel in the beds of our mountain rivers, where fall is lacking, has long been desired. The hydraulic elevator promises to successfully furnish that means.

PLUMAS.

TEMPORARILY SUSPENDED.—Greenville *Bulletin*, Nov. 30: In order to complete the new hoisting works at the Indian Valley mine, all other work has to be temporarily suspended. As soon as the machinery is ready, the hoisting of ore from the shaft will be begun; there is plenty of it in sight. The work is progressing rapidly and all will be fully ready in 3 weeks.

THE PROSPECT lately struck by Batcheider & Wing is turning out even better than was expected. The rock is now being crushed in a small mill in Dixie canyon, and is said to be yielding $40 a ton as far as worked. The claim is just below the old works of the Green Mountain and is supposed to be a slide from that great mine.

Mr. J. B. Scott, of the Southern Eureka, has purchased a controlling interest in the Taylor-Plumas mine, and has been elected President.

NO REASON FOR DECLINE.—There has lately been a heavy decline in the value of mining shares at the New York Stock Board. Why there should be any decline at all in the value of Green Mountain stock will be very puzzling to the people here. We all know the mine well, and what it is doing. Happening to drop into the retorting house a few days ago, we saw Mr. McCartney pour out a mass of molten gold into a mold. When cooled it was in the form of a sardine box, and was worth $3,200; this had been gathered from the plates in a few days. People living close to the mill are accustomed to see the same every few days, except that the ponrings are larger when the battery is cleaned out, often going over $5,000. We all know that the mine is doing better than ever before, and can only regret that every dollar's worth of the stock is not owned at home. If it were, the profits could be applied to the opening up of vast bodies of ore known to exist in the same mountain, and just as good as any in the Green Mountain mine. What a pity it is that the development of our mines and the production of vast amounts of wealth should be retarded by the manipulations of stock gamblers.

SHASTA.

COPPER CITY.—Redding *Independent*, Dec. 3d: The Chinese who went from Shasta to Copper City on the 24th inst., have not been molested. Another lot is expected soon, who will engage in mining the ground sold to them by T. Popejoy for $6,500, although the money has not yet changed hands. Potter & Hall expect to make a sale of their property to an Eastern company. By Dec. 29th it will be positively known whether a sale will be made. In the event that they do not sell, Tiffin, Cennon and others will make arrangements with Potter & Hall to work the surface diggings connected with the quartz mines, the coming winter.

ELEVATOR WORK.—Shasta *Courier*, Dec. 3d: A Colusa county man by the name of Orear is engaged in quite an important mining enterprise on the flat below the celebrated Flood's flat. A supply of water has been hargained for from the Hardscrabble Co's ditch, and an iron pipe with some 200 ft pressure is being put together on the ground. A Cranston elevator, or one similar, will be used to elevate the gravel and tailings so as to permit dumping into the creek. Jonas Smith, who recently visited and inspected the gravel mines near Yreka, which are worked by Cranston elevators, has the superintending of the work, and it is thought that the mine will be in running order inside of two weeks.

SIERRA.

RUBY.—*Mountain Messenger*, Dec. 3: The Ruby Co., at Cariboo, stopped work on their main tunnel some weeks ago, and since then have been raising a shaft to strike gravel. After going up about 80 ft some quartz mixed with bedrock was encountered, from which indication those in charge think they are on the rim of a channel. At a hight of about 62 ft from the bottom of the shaft a drift has been started into the ridge to test the theory.

OFF THE TRACK.—Last Monday morning the Bald Mountain locomotive ran off the track in the tunnel, owing to the spreading of the rails. A heavy train of loaded cars was being taken out at the time, and owing to the headway under which it was, it drew the engine about 250 ft before it stopped. Fortunately no one was injured, nor were any of the cars damaged. The men lost half a shift by the accident.

MARGARITA.—This is the name of the quartz mine at Loganville, formerly called the Hidden Treasure. The Co. have made rapid progress during the last 2 weeks. The works are now covered in. The dam is built and the flume partly laid. The hoisting engine is on the ground but not yet in place.

SEVENTY-SIX.—The owners of the Seventy-six mine, located southeast of the Pliocene shaft, on the same ridge, have let a contract to run about 300 ft of tunnel. The grades in the old tunnel became so heavy that the mine could not be worked to advantage.

GOLD BLUFF.—Vanslyke, of the Gold Bluff, has been putting on extra hands. The ledge looks and pays as well as ever. He will soon start a tunnel from the level of the mill, it is said.

ARIZONA.—The Arizona Co. are still running in the rim of their channel, on the north side of the main Pliocene ridge, about 1 mile north of the old Cornish ranch. The Co have a fine prospect.

HOG CANYON.—The mill at Hog Canyon, is all ready to run as soon as water enough for the engine starts. They have quite a quantity of good rock on hand with every prospect of striking the main ledge soon.

Work is still going on at the Good Hope mine, but they are not yet ready to run. Probably in a week or 10 days the mill will be running.

The Sierra Buttes Q. M. Co. of Sierra Co., last month paid a semi-annual dividend of 37½ cents a share, or $46,250, making a total of $1,899,025 to date. The Plumas Eureka's dividend was 75 cents per share, or $30,409, making a total of $568,750 to date.

EXTENSION.—The Bald Mountain Extension is getting pretty well prepared for winter. About 30 men are employed in and about the mine. Two shifts, of 7 men each, are worked breasting, and the average yield has been over an ounce per day to the pick. The Co. are still pumping water at the Pliocene shaft.

Work is still progressing at P. Grant's tunnel at the head of a branch of Caribou ravine.

The Chinese have abandoned their works in the river and taken out their pumps.

ECLIPSE.—Work is progressing in the Eclipse mine, the rock in the tunnel being moderately hard.

BALD MOUNTAIN.—The Bald Mountain Co. have their dumps about full, and unless water comes soon they will be obliged to discharge a large number of men for want of dump room. They have employed now about 100 workmen.

RAINBOW.—The rock in this remarkable mine is a marvel of richness. The Co. are now preparing to sink on the ledge where it was richest.

TRINITY.

NEW RIVER.—Cor. Trinity *Journal*, Dec. 3: The rainy season has set in in our parts earlier than usual and the miners are making the most of it. Nearly everyone is already ground sluicing and appearances are that this season will prove a prosperous one for New River. The Slide Creek Co. will, I believe, let their claim lie idle this winter as they have not as yet any body on it. Neither is there anyone on the Eagle Creek claim, although the latter paid very well last winter, as I have been informed by Mr. White, who ran it. Those two claims are the only ones on the river that are fitted with pipes and giants. The Portuguese Co., on Big flat have four men mining, the remainder being occupied blasting a channel through the rim rock. This constant blasting has been a serious drawback to this Co., as they have had 3 to 4 men almost constantly at it for a year or more. What a pity that their claim—acre in extent—is not fitted up properly with modern improvements? If it were so rigged it would pay big, for even now, slow work as ground sluicing is, it more than pays expenses. And by the way, no danger here of ever being troubled with the "debris question" there being no agricultural lands worth speaking of between here and the ocean.

TUOLUMNE.

RICH QUARTZ.—Tuolumne *Independent*, Dec. 3: Mr. Wm. Sell has struck very rich rock in his quartz mine near the French garden, on a spur of Bald mountain, Sonora. The rock exhibited to us is full of gold, one piece, as to weight, being one-half gold and one-half rock. The tunnel is in over 240 ft, being about 140 ft from the surface. The chute exposed is 20 ft—but neither end has been reached. It is found in three levels, the upper being 30 ft from the lower. The rock, as they stope up gets richer, and, if this continues a short distance, must reveal large masses of gold. Mr. Sell has stuck to this mine since 1850, or 31 years this month. He has worked it at different times since, and has taken out pockets aggregating many thousand dollars. The present find bids fair to eclipse even the famed Divoll bonanza. He has been taking it out largely for the past three months in a quiet way, but it has become so extensive that it has been found impossible to keep the matter from public knowledge. He pounds the rock in a mortar, and makes no statement as to the total yield to date.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—*Enterprise*, Dec. 3: Are cutting out a chamber for a winze in east crosscut No. 2, on the 2500 level; crosscut No. 3 has been extended 29 ft, and No. 5, 30 ft. Have completed and started the suction fan over the old shaft.

UNION SHAFT.—Are repairing the drift in the 1600 level out to the Sutro tunnel connection, easing timbers in shaft and cutting out bob pit at the 2600 station.

UNION CON.—The joint Mexican drill hole east on the 2700 level has been extended 115 ft. The joint Sierra Nevada winze on the 2700 level has been sunk and timbered 10 ft, and the joint Sierra Nevada east drift was extended 39 ft.

OPHIR.—During the week 268 tons of ore were extracted from the croppings and 470 tons sent to the mills. Assays not yet received from the mills.

CON. VIRGINIA.—Are still opening out and repairing drifts and winzes connecting with the old Con. Virginia shaft for ventilation.

CALIFORNIA.—Still opening out and repairing drifts and winzes connecting with the old Con. Virginia shaft.

YELLOW JACKET.—There has been no work done in the mine since Wednesday morning, the 30th ult., on account of water on the lower level, caused by the stoppage of the pumps to replace two lengths of defective pump-rod, which have been gradually getting worse.

SUTRO TUNNEL.—Since last report the three shifts employed retimbering and repairing the heavy ground near the Combination connection, have placed in position 13 sets of new timbers and 10 posts, and removed 9 sets of old timbers, 9 posts, 2 stringers and 3 drain boxes; also the usual repairs have been made on the track and a'ong the main line. A new set of timbers has been put up at the tunnel entrance, and some repairs made at that point.

BERNICE DISTRICT.

A NEW CAMP.—Reese River *Reveille*, Dec. 1: Last spring Wallace Goodall, C. W. Gilbert and others organized what is called Bernice district, near Humboldt and Churchill county boundary line. Some fine ledges were discovered there, with in a short distance of the old Graves & Healey antimony mines. The ore is principally chloride and free from base metals, and there is considerable timber in the vicinity of the mines, which are situated about 10 miles from the Humboldt Salt March, and about 90 miles south of Winnemucca. Wallace Goodall, one of the discoverers of the district, was in Austin a few days ago, and said the Golden Crown lead, in which he is interested, is from 3 to 7 ft wide, and is situated between the syenite and limestone formations. Fifty or more assays have been made of the ore, yielding from $48 to $547 per ton. Hoyt & Gilbert own the north extension, which is also showing well. There are quite a number of other locations in the district. Wood and water is said to be abundant for mining purposes.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, Dec. 3d: During the week the west drift in the fourth shaft level has been advanced 12 ft in a hard quartz formation, carrying a small streak of low grade ore. The upraise from this drift has shown no material change. Other shaft levels are yielding about the same quantity of ore as last week. All work in and about the mine is progressing as usual, and the daily output of ore has been about 60 tons. Both mills are running steadily and are doing the regular amount of work. Bullion shipments for the week ending Nov. 30th, $20,621.31. Shipmeuts on the November account to Nov. 30th, $31,818.20. There will be one more shipment on November account, which will bring the aggregate shipment for the month up to about $90,000.

MOUNT DIABLO.—Winze No. 1 has shown but little change since last report. An upraise is being made in the bottom on ore that assays from $60 to $75 per ton. The east drift, from the north crosscut at the foot of this winze, has advanced 10 ft and is showing a 12-inch ledge of ore assaying from $40 to $47. The east drift on the 3d level, north crosscut, from winze No. 8, has been driven ahead 11 ft. In the east drift, on the same level, there is a good body of ore which looks promising, though not enough work has been done at this point to determine the extent. An assay from selected ore gave a valuation of $387. The winze from the east drift on the second has connected with the upraise from the third. The winze from the west drift on the second level is down 27 ft. The west drift on the third level has advanced 13 ft.

EAST MOUNT DIABLO.—Work has been resumed on this mine, and from the manner in which the management have taken hold it is apparently the intention to continue it until satisfactory development is made on a small scale, when a larger force will be added. The recent splendid showing in the east drift from the 3d level of the Mount Diablo has put new life into the East Mount Diablo people, and it is argued that if $387 ore is found on the west line there is no reason why it should not extend into the main East Mount Diablo ground. A little pluck, muscle and money will determine it.

GENERAL JACKSON.—Fair progress is still being made in the drifts, though the ground is refractory. The ore bodies that have been cut thus far are somewhat broken and disconnected, though, in places, carrying ore of high grade. It is the intention of the company to prosecute work in a vigorous manner, and possibly sink to a greator depth to get into and cut a country where the formation is more firm and compact. However, the work of prospecting will be continued as vigorously as possible in the present levels.

LUCKY HILL.—The northeast and southwest drifts are still being pushed ahead as fast as possible. Fair speed is making, considering the character of ground through which they are being run.

ESMERALDA DISTRICT.

THE CORTEZ MINE.—The mine is looking better than ever before. The ledge at every point where work is being prosecuted shows ore of good quality and plenty of it. The prospects are certainly flattering for the Cortez to become one of the richest mines on the Pacific Coast. The credit is certainly due to the management of Supt. Wells for uncovering the large and rich bodies of ore in the Cortez, which will go far toward making Aurora boom before long.

ORE.—Esmeralda *Herald*, Dec. 3: Hernleben & Erway shipped an 8-horse load of ore last week from their mine to Gold Hill for reduction. They have been at work on the claim for some time, and we learn have a good prospect. The ditch for conveying water to the mill that is soon to be erected, is finished about one-third of the distance. H. Aldrich will soon move his family into the district.

EVA CON.—Thursday morning ground was broken on the Eva Con. mine for a two-compartment shaft. To what depth the shaft will be sunk this winter is at present unknown. The Eva Con. property is on Aurora hill, and in the incline shaft as far down as it has been sunk is a good-sized ledge of milling ore.

KINGSTON DISTRICT.

VICTORINE.—Eureka *Sentinel*, Dec. 2: J. J. Kermeen, of the Ruby-Dunderberg, R. Rickard and W. H. Sweeney came home from Kingston Wednesday afternoon by private conveyance, making the 85-mile trip between 8 o'clock in the morning and 6 in the afternoon. Mr. Kermeen informs the *Sentinel* that the Victorine is a splendid property. The formation is a horizontal deposit, or "blanket ledge," of iron pyrites, from 8 to 10 ft thick, and gold. The main tunnel, under the vein, is 80 ft in length, while there are a number of other and shorter tunnels parallel with this. The ledge has been explored at many points from all these tunnels, and, with a little upward rise, continues the same throughout. Much of the ore goes between $400 and $500 in gold, and it ordinarily carries $8 to $10 in silver. It is very rebellious owing to the large proportion of iron it carries. It is being worked by a new chlorination process, the success of which seems assured. From the mouth of the main tunnel the company have a railway 1,500 ft in length, from the terminus of which a tramway extends 1,580 ft down to the valley road, from which point to their 30-stamp mill the distance is two miles. The mill will be ready to start up in a month.

MOUNT GRANT DISTRICT.

BUSY.—Esmeralda *Herald*, Dec. 3: Mrs. H. Aldrich made Mt. Grant a visit the first of the week, and relates to a *Herald* representative that every body in the camp is busy. E. W. Bennett has charge of putting in the new machinery at the Big Injun mill, and expects to have the mill running about the middle of this month. Cory City presents a lively appearance, and the mines at work are working well. There is not an idle man in camp. When the mill gets ready to crush, bullion will be shipped regularly from the Big Injun mine.

SAFFORD DISTRICT.

ENORMOUS DEPOSIT.—Eureka *Sentinel*, Dec. 2: From Rohl. Crossan, who returned from Cayuga yesterday, we learn that the mines in that camp have a prospect of being immensely valuable. He says he saw upwards of 50 assays from the Onondaga mine which ran above $400. He saw a great many more assays of ore from the same mine which go from from $18 to $600. Mr. Crossan, who has done a good deal of prospecting himself, has an idea of his own about the formation. He thinks that they have no wall—nothing but a clay seam—in the Contention, which lies between the Onondaga and Illinois on the same hill and runs parallel with them. He thinks that these three mines make up a single ledge from 800 to 1,000 ft in width. He says that he thinks that there are only two walls (of porphyry), one bounding the outer limit of the Onondaga above and the other bounding the Illinois below; and because the "stringers" (mistaken for ledges) in the adjoining mines northeast and southwest bend into this mammoth deposit and assume its direction or near approach. The mass of ledge matter is manganese cut with stringers of ore, the manganese carrying a very small per cent. of silver. The ore is dark colored, hard and with streaks of sulphurets. It is similar to the ore from the Eureka Tunnel, but darker. The assays referred to are bona fide and made by Tyson, who has all he can attend to in his business.

ARIZONA.

STRIKE IN WARSAW.—Arizona *Citizen*, Nov. 30: Mr. J. M. Kirkpatrick came up from Oro Blanco this morning, and brought specimens of ore from the new strike in the Warsaw mine, the property of the Orion M Co. The bonanza was reached last Saturday at a depth of 75 ft, and the ledge was found to be 3 ft wide, the ore averaging across the ledge $600 per ton. The ledge is all ore, and the walls are perfect, being between syenite and porphyry. The Warsaw mill has been idle for a short time awaiting shoes and dies, which were forwarded to-day from this city. The mill will start up next Sunday on the rich ore, and a continual stream of shining bullion is expected to follow. In doing the assessment work on the Alaska mine, near the Warsaw, also the property of the Orion Co., at a depth of 45 ft a 4-ft ledge was encountered that assays an average of $150 per ton. Some specimens run up to $1,500. The importance of these rich strikes to that district and to Arizona are very great.

MILL AND SMELTER.—Arizona *Democrat*, Nov. 30: C. C. Bean has dismantled the Hoeffler mill, preparatory to locating it on some of his producing properties; he has also erected a smelter on his copper mines, on Castle creek, having lately removed the machinery from Charlie Genung's residence, in People's valley. The Bed Rock M. Co. are engaged actively on their property near the Model mine. The mill is running day and night on good gold ore. Gov. Power's mill, at the Model mine, is running constantly on good ore from that mine.

MILL.—Some San Francisco capitalists propose to erect a 10-stamp mill on the Niagara mine, near the Model mine. This will make three stamp mills within a circle of a mile. That speaks very well for that district.

SILVER BELT.—Daniel C. Thorne returned, yesterday evening, from the Silver Belt mine. Whilst there, he shipped $20,000 in bullion to San Francisco, the result of the last run. We propose to give a detailed statement of the amount of bullion taken from this mine since its first working, and will show that its net results go way up into the hundreds of thousands. There has been a continual stream of bullion pouring from the mine for the past two years. There is a force of 22 men at the mine and smelter. Tim Gleason proposes to prospect with Mr. Ward in the neighborhood of the Dosoris. Several very rich discoveries are on the *tapis* in that neighborhood.

HYDRAULIC.—From Mr. A. Moody we learn that the hose necessary to hydraulic the Lynx creek placers are on the way from Chicago. There is a force of men at work enlarging the reservoir. The ditch is all repaired, new flood gates put in. As soon as the wet weather comes, then active work on the claim will be pushed.

TONTO BASIN.—Arizona *Journal*, Dec. 1: The outlook of Grass Valley mining district is very flattering, as all the prospects improve as depth is gained. The Excursion mine is giving promise of an exceedingly rich property. They have 7 ft of good milling ore in the bottom of the shaft. It is an assured fact that the Co. is having an improved quartz mill built for their property. The ore they are getting will probably mill $25 a ton. They have several hundred tons on the dump. The Gowan mine is looking splendid. They have five and a half of high grade ore at a depth of 85 ft. I guess it is an assured fact that the Excursion Co. have bought the Gowan mine for the sum of $40,000—at least that seems to be the prevailing opinion of men that seem to know. If they have bought it they have got one among the finest prospects in the Territory, as the ore has continued to improve from the surface down to the present depth. Birchett & Chilson are putting up arastras on the Golden Wonder mine. They intend to use steam as the motive power. They feel confident that they will make a success of working their ores by erastra process.

MAGAZINE DISTRICT.—Arizona *Gazette*, Dec. 4: Last Sunday M. Asher & Bro. received a little over a ton of ore from the Red Rover mine, in the Magazine district. In a few days they expect to receive another load, when the entire amount will be shipped to San Francisco for reduction. This ore is of a high grade and is expected to yield all the way from $6,000 to $10,000 to the ton. The Red Rover is owned by John A. Cox & Co., and these gentlemen, being possessed of but limited means, have not been able to work the mine to the extent that its apparent worth would justify.

COLORADO.

RED ELEPHANT.—Georgetown *Courier*, Dec. 4: The new shaft and ore house at the Barrett shaft on the Boulder Nest mine, is completed; the engine has been repaired and is in running order; the new spool and running gear are on the ground, and it is expected that hoisting will be resumed on next Monday morning.

STRIKE ON REPUBLICAN.—A good strike was made last Friday on the Olympic lode, situated up Cherokee gulch, about 2,000 ft above the Pelican-Dives, and in line with the Diamond tunnel. The lode is owned by Capt. J. F. Phillips and H. N. Moore, who have driven an open cut about 20 ft to the lode, where they struck a 5-inch vein of ore that assays 438, 672 and over 1,100 ounces of silver to the ton, and also a fraction of an ounce in gold. The quartz from the vein, carrying specks of ore, assays 42 and 98 ounces. The strike is a very promising one, giving unmistakable indications of a valuable property. An ordinary specimen, about what this ore will average, assayed 652 ounces.

The Ariadne lode, on Spring creek, Trail Run district, owned by N. J. Moss & Co., is showing a very large body of gold ore. The shaft is 55 ft deep and shows a vein of quartz from 4 to 8 inches thick that has produced mill-runs of from 30 to 60 ounces of gold per ton. There is also a body of quartz from 12 to 14 ft thick that prospects well in the pan, and would pay handsomely if there was a quartz mill conveniently situated so that it could be treated.

LAST week an encouraging looking strike was made in the Louisiana lode, on Sherman mountain. While sinking the shaft, at a depth of 55 ft a vein of good looking ore was encountered about 4 inches thick, which is growing larger as it is being sunk upon, and gives indications of changing to a large body of ore within a short distance. The lode is situated near the Meadota, about 1,000 ft below the Dunderberg, and is owned by the Louisiana M. Co., a St. Louis corporation, of which Mr. Stephen A. Beemis, of that city, is president.

IDAHO.

THE OUY MINE.—Wood River *Times*, Nov. 30: This mine, located by Messrs. Garrard & Campbell last year, and which distinguished itself by a quick shipment of 10 tons of ore to Salt Lake City, which netted $3,050, has just passed into the hands of a company formed at Toledo, Ohio, through F. J. Scott, of that place. The mine was bonded in Sept. last, Mr. Scott being associated in the bond. The mine is located 10 miles southwest of this place, on one of the head streams of Rock creek, 2 miles south of the Ornament and Ohio mines, and 6 miles southwest of the Bullion group, above Croy creek. The formation or country rock in which the vein occurs is a soft, whitish, quartzose granite or granitic porphyry. The vein itself is a wide one; how wide is not yet known, as the workings, which follow the footwall at an angle of 25° from vertical, have all been in clay and vein-matter—all picking ground. The owners had about 50 tons of ore on the dump and some in sacks on the road to our smelter, when the latter shut down, after having worked a small lot of 4,860 lbs., which yielded $200 a ton. Work is to be kept up at the mine by a small force this winter, in charge of Henry Selkirk, foreman.

ATLANTA AND ROCKY BAR.—Wood River *Miner* Nov. 30: Mr. Yount reports times at Atlanta and Rocky Bar about as usual with small mining camps at this season of the year. Some 50 men are employed about Atlanta. The Bonaparte mill, near Rocky Bar, is crushing ore from that mine. Snow on the divide between Atlanta and Rocky Bar is 4 ft in depth. No work is at present being carried on in the Yuba tunnel. It is in about 700 ft. The Buffalo, Last Chance, Monarch and several other mines of Atlanta are working. The Ida Elmore Co., at Rocky Bar, is putting up elegant hoisting works. They will be ready for use inside of a month. The Buffalo mine is looking fine, and the mill has been pounding almost incessantly for the past 18 months on ore from it and other mines. Mr. W. H. Pettit, Supt. of the Monarch mine and mill, is now on his way East to meet the company. It is thought they will have a new mill in the spring. If they do not build they will remodel and greatly improve the old one. The Tahoma mine, purchased by an Eastern Co. last spring for $110,000, is in splendid shape. It is estimated that two-thirds of the amount paid for it is now in sight. The Tahoma Co. have a fine mill stored at some point between Kelton and Atlanta. It was the intention to get it in and shove it up this winter, but delays and bad weather prevented it.

MONTANA.

PARROTT.—*Inter-Mountain*, Nov. 28: The Parrott is being vigorously developed. The main shaft cut the ledge at a depth of 160 ft. A drift east has since been extended on the vein to a length of 100 ft and is still being driven ahead. The ore body in the face is about 5 ft wide and assays between 18% and 25% in copper. A fine block of ground is thus being rendered available for stoping. The present ore product is being shipped for reduction to the company's smelter, where about 100 tons of matte, assaying 60% copper, have lately accumulated. The enlargement of the works is progressing rapidly. The Parrott Co. employs about 40 men.

WASASH.—The water in the mine occasions very little trouble and the machinery is running smoothly.

BELL.—A contract has recently been let for the shipment of 40 tons of ore per diem from the mine to the smelter. Over 300 tons of first-class ore have recently been extracted.

AT THE Bell smelter everything is proceeding satisfactorily. On Saturday morning one of the roasting bins was fired up. It contains 100 tons of ore placed between two layers of cordwood, which on being lighted are supposed to ignite the sulphur, of which the ore carries about 30%. The sulphur will burn out, Mr. Longmaid says, in about one month, the percentage being sufficient to maintain a constant fire without the addition of any more wood. The other bins will be started up as soon as the ore can be hauled down from the mine, which work is delayed somewhat by the scarcity of teams. On the completion of the roasting process the ore will be ready for the water jacket furnaces, the erection of which is finished.

BULLIONVILLE, Nev., is quite lively. The furnace is running well, and many teams are engaged in hauling ore, wood, etc.

Gold and Silver in Use.

The annuel report of the Director of the United States Mint for the fiscal year ended June 30, 1881, contains, in addition to customary detailed statements of the operations of mints and assay offices, much valuable information in regard to the production of precious metals in the United States and in the world; their use in the coinage of this and foreign conutries; consumption in arts and manufactures; specie circulation; comparing paper and metallic circulation for a series of fifty-six yeare, with the percentage of yearly prices to the mean prices of staple articles; indicating annual variations; gold and silver received and operated upon by all the mints and assay offices, exceeding by more than $50,000,000 the receipts of any previous year, amounting to $226,225,522, of which $103,371,101 was gold, and $32,854,421 eilver.

This large increase was due to the continued influx of gold from abroad, over $95,000,000 deposited being from that source alone. The coinage facilities of the mints have been enlisted to their fullest extent in converting this hullion into coin. The gold coinage amounted to $78,733,864, of which $15,345,520 was in double eagles, the remainder in coins of leseer denominations. The coinage of eilver was confined to the minimum value of silver bullion required to he coined by the law authorizing the coinage of standard eilver dollars, $27,637,950 of which were struck. Of euhsidiary coins only $12,011 were coined, and of base metal or minor coin, $405,109. The totel coinage of silver dollars since the passage of the act for their coinage, up to Nov. 1st, was $100,672,705, of which $34,096,327 are in circulation, and $58,833,770 are held by the Treasury for the payment of outstanding silver certificates, leaving $7,137,608 for dishursement hy the Treasury in ordinary payments.

The usual examinations and settlements were made at the close of the year.

Referring to the probahle restoration of silver to its former place in the monetary circulation, the Dirctor says that in view of the failure of the International Monetary Conference to agree upon any practical measure, and while awaiting its future action, it is a question for our own serious aud early consideration whether it is desirable to suspend further coinage of silver until, hy international agreement and effective legislation, the unlimited coinage of silver and gold at common fixed rates shall be provised by the principal commercial nations of Europe and America. Should the $65,000,000 in silver coin now full legal tender in Europe, be demonetized, the United States could not, singlehanded among commercial nations, sustain the value of silver from inevitable fall. With that danger menacing us, we cannot, without serious embarrassment, continue such coinage. Unless other commercial nations will agree upon the general use of silver as well as gold, the further coinage of silver dollars of the present weight, unless needed for circulation, is a useless oxpenditure.

Director Burchard estimates the world's production of gold for the calendar year 1880, at $107,000,000, and of silver $87,500,000. The consumption of the world in ornamentation, manufactures and arts is estimated for the same period at $75,000,000 gold and $35,000,000 in eilver. The estimated calculation in the principal countries of the world is placed at: Gold, $3,221,000,000; full legal tender silver, $2,155,000,000; limited tenders, $423,000,000; total specie, $5,757,000,000; paper, $3,644,000,000; making the total circulation, including the amount held in Government securities and banks, and in active circulation, $9,403,000,000. Upon the subject of the course of prices, and indicating the annual varietions in the purchasing power of money in the United States, the Director has prepared tahles showing the average annual prices for 56 years, with the mean prices of gold aud eilver, and also the relation which the average annnal price of each article beare to the mean price for a whole term of years. The mean percentage for each year of all the articles named furniehee a hasie for measuring the purchasing power of money, and is instructivcly compared with the per capita circulation and estimated wealth for each year.

Some of the Bad Effects.—Should it be finally determined that hydraulic mining muet cease, the prosperoue section of Nevada county, known as the Ridge, would become a deeert. The towne of Washington, Omega, Eureka, Moore'e Flat, North Bloomfield, Cherokee, Columhia Hill, North San Juan, Sweetland, French Corral and all other intermediate camps would straightway he deserted. Every branch of trade there depends upon the prosperity of the hydraulic mines, and must stand or fall with them. There are no quartz-mining, farming or lumhering intereete there wortb mentioning. The several thousande of lahoring people there would he rcduced to want, their cosy homee rendered valuelees, and decolation would reign eupreme. The hlow would he alao felt in thie part of the county with terihle effect. At least eeven or eight rich hydraulic mines in the township would he rendered unproductive, the half a hundred teame engaged in transferring freight from the railway here to the ridge would find their occupation gone, the immenee trade, most of which now comes to our merchants, instead of enriching Maryeville as heretofore, would he ruined, city real eetate would drop to ruinoue prices, and the etirring county aeat would resolve itself into a half-deserted village. —*Nevada Transcript.*

The Carson & Colorado Railroad.

Trains, hoth freight and passenger, are now being run to Soda springs, on the Carson & Colorado railroad. This point is 137 miles from the Mound honse (the western end of the road), and 13 miles from Belleville. Soda eprings will be the stetion for freight and passengers until the road reaches Belleville. Stages now leave Soda springs daily for Belleville, Montezums, Candelaria, Gold Mountain, Silver Peak, and other places in that direction.

At Lunning, 125 miles from the Mound house, etege lines connect the road with Grantsville, Tyho, Belmont and other placee in that part of the State. To-day (Dec. 1st), Gilmer, Salishury & Co. will put on their etage line, connecting with Grantsville, Belmont and several other leading towns and camps in the eastern part of the State.

The road, as far as built, is highly spoken of by all who have heen over it. The road bed is well constructed, and the track very well and carefully laid. Those who havo traveled over the Carson & Colorado are loud in its praise. They say they have never seen its equal for emoothness. For miles on miles there is neither jolt uor jar, the best of eteel raile having been used.

The road will he rushed through "in spite of wind and weather." The company have now on hand 1,000 tons of steel rails, and have ahead 100,000 ties, with more rails and more ties coming right along. The road will he completed to Belleville hy the 15th of this month, and about the 1st of January the care will be running into Candeleria. As each point is reached, trade is opened in all directions.—*Enterprise.*

How to Preserve Autumn Leaves.—A contemporary answers, as follows, the question, "What are the best methode of preserving autumn leaves and when should the leaves be gathered?" It depends somewhat upon the season when the leaves develop their greatest beauty and variety of tints. Sumac and the leaves of similar plants or trees are usually gathered early in Octoher. Maple, alder, oak, linden, etc., are now at their best. To preserve the leaves they sbould be thoroughly dried as soon as possihle after gathering and trimming. A simple method of drying the leaves expeditiously is the following: Spread the leaves and press in a suitable pen with alternate layers of fine sifted dry eand heated as hot as the hand can hear, aud set aside to cool. When the sand has cooled, the leaves may be removed, smoothed under a hot iron, dipped for a moment in clear French spirit varnish, and allowed to dry in the air. Melted paraffine and wax are sometimes preferred to the varnish. The following is another way: Spread eeveral thicknesses of fine wrapping paper on the ironing table; arrange the leavee of the spray, picking off those which do not add to ite hsauty, and lay it out smooth. Pass a warm fleiron over a cake of wax and then over the leaves—first on one side and then on the other. Then place the sprays hetween sheets of bihulous paper, and put under pressure hetween two flat hoards, for ssveral weeks, changing the paper several times.

Hydraulic in Idaho.—Buzzini, Brodtmiller & Spearn finished the season's run, about two weeks ago, in their hydraulic claim between Granite and Hoodoo creeks, about two miles east of town, and mede a very handsome clean-up. This company commenced operatione there about eight years ago, and since that time have been adding to the property hy huying one claim after another, and now they own all the ground hetween the two creeks. As Paul Buzzini says, the area ie not epoken of as feet, hnt miles. The compauy worked nine men the past season, and with a force no less than that it is estimeted that it will take at least 50 years to work out the ground, all of which prospects well. This hydraulic, the past eeason, was turned loose on Crepiecola hill, and the gronnd there ie now opened in good ehape for working to good advantage next year, and if the water holde out as long ae it did this season, the cleanup from the next run will exceed the last by 400 or 500 ozs. The ground on this hill is 30 ft. deep in the shalloweet placee, and 100 ft. at the deepeet with an average of about 50 ft. A numher of ditchee, the total lengths of which are about 30 milee, have been brought onto the ground. The company has five reservoirs, and with them are enahled to run the pipe aeveral hours each day for some time after the water in the ditches falls below what is required for contiuuous working.—*Idaho World.*

It is well known that the minee that are worked to a profit by hydraulicking would, in ecarcely a single instance, pay hy the drifting process, and muet be worked by the present mode or not at all. The abandonment of hydraulic mining would make no increase in drift mining over what ie now done. Minere understand what ie practicahle in the way of gravel mining, and adapt their operationa to the character of the ground to he worked.

Carson is again agitated on tbe subject of smelting worke. It is thought that two furnaces with the capacity of from 10 to 15 tona each can be kept supplied with copper and eilver ore from the minea of the neighborhood and of Genoa.

The North Fork dam, on the North Fork of the American, near Auburn, is completed.

Second-Class Passengers on California Railroads.

At a recent meeting of the California Board of Railroad Commissioners, the following resolutions were introduced by Gen. Stoneman:

Ordered: First—that from and after the first day of January, 1882, second-class accommodation for second-class passengers shall be furnished by and over all railroads in this State, at rates of fare not to exceed 60% of the rates charged for first-class passengers on the said roads for the same distances, in the same directions and hetween the same stations.

Second—That eecond-class passengers ehall not be required to travel in smoking cars.

Third—That second-class passengers shall have the same right to lay-over tickets on all the railroads in the State as is granted to first-class passengers.

Gen. Stoneman, in commenting npon the resolutions, said: "The first order is predicated upon the well-known principle, as enunciated by railroad managere, that tariffs are hased upon what the commodity will hear. If the first-clase passenger ie charged wbat he will bear, certainly the second-class passenger ought not to he expected to pay as much as the first-class, and should bc charged what he will bear, and no more.

"The second order is dictated by sentiments of common decency and common humanity. First-class passengers have no more right to enter second-clase cars to do their emoking than second-clase passongers have to enter first-clase cars to do the seme thing. The rights of the second-class passenger are as sacred as are the rights of the first-class passenger.

"The third order is simply carrying ont the theory that railroads are, or should be, managed and operated in the interests and for the benefit of the whole public, the poor as well ae the rich, and when they fail to do thie they fail to accomplish tbe principal ohject for which they were authorized and created. Lay-over tickete entail and necessitate no additional expense upon the railroads, and no reason exists why they ehould not he furnished when reqnired by the second as well as the first-class passenger.

"It is not expected that second-class passengere ehall be furnished with first-class accommodations, or with upholstered cars; all that is required is that they shall be transported over the roads at such rates as they can afford to pay.

"The passage of this order will work to the great advantage of nine-teuths of the people of this State, and, I am firmly convinced, will result in no loss to the railroads, but, on the contrary, the increase in the volume of second-class travel will more than compensate for the decrease in the number of first-class passengers. Whether it does or not, it ie no more than the public have a right to demand; and if the railroad companies were wiee, they would grant it without the asking."

The consideration of the resolutions wae laid over until the next meeting of the Board.

Matters at the Savage.—Tho Savage Co. are now daily shipping to the Santiago mill, Carson river, from 90 to 200 tone of ore. There is now at the mill about 1,000 tons of ore (which is about all for which room can he fonnd without doing a good deal of shoveling) with about 800 tons in the dump at the mine. There are now 80 men employed at the mine. The ore hreast on the 1640 level etill comtinues to look well, and much good ore ie being obtained on the old Potosi tunnel level. On the 1100 level, crosscut No. 2 night before last cut through a solid wall of clay about three feet thick, and yesterday the face was passing into quartz of a promising appearence. Ore is liahle to he found at this point. The drift from the Chollar-Norcroee-Savage ehaft on the 2400 level is etill in the bard black rock, hut notwithstanding the hardnese of the rock the drift is being pnshed ahead at the rate of 10 ft. a day. The hlast fired in the face of the drift can now he heard in the bottom of the incline or rather at the level of the water, at the 2200 etation. At 2 o'clock P. M. day hefore yeaterday, when they were ahout to hlast in the drift, Supt. Keating poated himself in the incline and heard the ehots very dietinctly. The air ie very good at the face of the drift. The Santiago mill will etart up next Monday. W. H. Armetrong, formerly of the California mill, in this city, ie Supt.

Gold in Chile.—Saya the Lebu *Liberal:* It is now heyond douht that the Montana Negra gold minee are of anch richneee that they will influence not only the futnre of thie province but that of the republic. They are sitnated in placee where water and timher are ahundant, at a short distance from this city, and at five leaguee from Canete. Only preliminary workinge have been carried out, and yet it may be affirmed that hnndrede of thoueande of dollare have been taken out. October 8th, a nugget which weighs 3,005 grains was found. The gold field covers an extent of eix leaguee south to north hy two from east to wcet. A hig nugget, taken out by Smith & Soreano, measuree 6½x3½x2 inches.

Wabuska has become a heavy ehipping point. All the freight from Mason valley and the mining districte in the neighborhood is handled there, and nearly all for Cory dietrict. The Poatoffice has been moved from Swasey's down to the etation, and a store, a boarding houee and a grain depot are already erected.

To the Sutro Tunnel Level.

Following are the depths from the hoisting works of the leading mines to the level of the Sutro tunnel or its branches; also the angles of the inclines, where there are inclines from the bottoms of the main vertical shafts:

Utah, 1,465 ft.; angle of incline, 46°; Sierra Nevada, 1,501 ft.; Union shaft, 1,502 ft.; Ophir, 1,600 ft.; pitch of incline, 37°; C and C shaft, 1,510 ft.; Con. Virginia, 1,625 ft.; Bonner shaft (Gould & Curry mine), 1,676 ft.; angle of incline, 55°; Gould & Curry and Best & Belcher shaft, 1,448 ft.; Savage shaft, 1,650 ft.; pitch of incline, 38½°; Hale & Norcross, 1,626 ft.; pitch of incline, 40½°; Chollar-Norcross-Savage shaft, 1,598 ft.; New Yellow Jacket shaft, 1,513 ft.; Old Yellow Jacket shaft, 1,430 ft.; angle of incline, 45°; Old Bullion shaft, 1,766 ft.; angle of incline, 41½°; Con. Imperial, 1,732 ft.; angle of incline, 43½°; Crown Point, 1,394 ft.; angle of incline, 35°; Belcher shaft, 1,449 ft.; angle of incline, 33°; Overman shaft, 1,201 ft.; Forman shaft, about 1,495 ft.; Caledonia, 1,153 ft.; Alta, 1,030 ft.; Justice, 930 ft.; pitch of incline, 40½°; Silver Hill, 757 ft.; pitch of incline, 38°; Old Chollar-Potosi ehaft, 1,695 ft.; pitch of incline, 45°; New York, 1,059 ft.; Baltimore, 1,205 ft.; pitch of incline, 38°. These measurements are from the surface of the ground at the top of the sbafts.—*Enterprise.*

Wood River Smelter.—On Thursday afternoon the Wood River Smelting Co. put out their fires and cnded this year's smelting campaign. The company are tho pioneer smelters of Wood River. The emelter was shipped into thie country last spring, and after some delay from various causes, was ready to do work in July. Of course, the "10-ton affair," as they termed it, has long since vindicated itself, hut its record will be of interest. Operatione commenced on the 25th of July, and closed on the 15th inst., but during that time the works were idle 35 days from lack of ore, fluxing, etc., which makes 79 the total number of days in operation. In this run of 79 days duration, through the efficient management of Mr. A. Wolters, one of the company, the furnace turned ont 288 tons of bullion, valued at $200 per ton in silver, besides the lead. This ie the yield of 650 tons of ore. In redncing this ore 294 tone of iron ore and 100 tons of limerock were used. There are $6,000 worth of matter on hand which could not he reduced this fall for the want of fluxing. Work will be resumed on May 1st, next year, when the facilities for reducing ore will be greatly increased.—*Wood River Miner.*

Rough Railroading Work.—According to Andrew Onderdonk, the well-known contractor, who is at present in the city, the building of the 125-milo section of the Canadian-Pacific Transcontinental railroad, on which he ie now engaged, presents unprecedented and almost incurmountable difficulties in the way of railroad huilding. The men employed in the work have to lahor on scaffoldings and etagings euspended over cliffs at great hights. The road, which is hetween Port Moody, on Burrard's inlet, and Halifax, N. S., is 4,500 milcs in length, the longest continuous road in the world. The section Mr. Onderdonk has in charge is hetween Yale, on the Fraser river, and Lake Humboldt. In a distance of 25 miles there are as many tunnels, and the entire section of 125 miles will have to he shelved and galleried. The section will be completed in three years. At present there are 3,000 men employed, and in the spring there will be about 10,000, half white and half Chinese. The estimated cost of the entire road is $60,000,000.

The Life-Saving Service.—The superintendent of the Life-saving Service in his annual report says: At the close of the fiscal year the eervice included 183 etatione—143 on the Atlantic, 34 on the lakee and 6 on the Pacific. The numher of casualtiee on the Atlantic coast within the ecope of the eervice wae 151; on the lakee, 94; on the Pacific, 5. The numher of people loet wae 26; the numher brought aehore hy life-saving appliancee was 408, and euccor was afforded to 407. At the varioue etations, 178 veesele were helped by the life-saving crewe to get off when stranded and piloted to places of eafety. The estimated valne of the veesele wrecked within acope of the eervice, together with cargoee, is $4,074,752, of which amount $2,828,680 wae eaved. The General Superintendent recommende the eetahlishment of additional statione on the Atlantic coast and lakee, and urgee an increase of wagee of the men employed.

More Successful Artesian Wells.—An artesian well, sunk on the premisee of the new huilding of Huntington & Hopkins, on the corner of Front and Market streets, supplies much more water than ie needed on the premises, and is of excellent quality. In excavating for placee for new elevator machinery, new welle have been found, one of which, at a depth of 40 ft., eupplies a quantity in excess of the mechanical and other neede of the new huilding the firm has just put up.

The new tank which ie to supply water for the hydraulic pump at the Chollar-Norcross-Savage ehaft will be 100 ft. long, 20 ft. wide and 10 ft. deep. Workmen are now engaged upon it. The pipee which will carry the water from thie tank to the pump will be one foot in diameter.

The Engineer.

Successful Moving of a Large Hotel.

At a recent meeting of the Engineer's Club, of Philadelphia, the secretary read a detailed description of the moving of the Hotel Pelham, corner of Tremont and Boylston streets, Boston, for the purpose of widening Tremont street. The hotel is built of freestone and brick, 96 and 69 ft. frontage. The Boylston street wall is supported on 8 granite columns 12 ft. high, 3 and 4 ft. square. There is a basement and 7 stories above the sidewalk. Hight above tramways upon which it was moved, 96 ft. Weight, 5,000 tons, exclusive of furniture, which was not disturbed during removal, as also were not the occupants of the stores on first floor and some of the rooms. The general arrangements for moving consisted of heavy and substantial stone and brick foundations for iron rails and rollers, and the building was forced to its new position by 56 screws, two inches diameter, half-inch pitch, operated by hand against timbers arranged to uniformly distribute the pressure against the building.

Much care and ingenuity was displayed in the details of the arrangements and work. Two months and 20 days were occupied in preparation, but the actual time of moving was but 13 hrs. and 40 min. The greatest speed was 2 in. in 4 min. The hotel moved about one-eighth of an inch at each quarter turn of the screws. The whole distance moved was 13 ft. 10 in.

Four thousand three hundred and fifty-one day's labor was required for the work. The whole cost was $30,000. This is the largest building that has ever been removed, although larger have been raised, which latter is a much simpler and less risky operation. The complete success of this undertaking is shown by the fact that cracks which existed in the walls prior to removal were not changed by the operation. Paper was pasted over them before commencing, so that if any change occurred it might be seen.

A Great Piece of Masonry.

Among the many splendid specimens of masonry which have from time to time been erected in various countries, and are pointed at as monuments to the honor of their designers, the largest and most splendid masonry arch in the world is probably the least known. Erected, along with many other engineering works in connection with the Washington aqueduct, of which it forms a part, during the decade immediately prior to 1863, very little public attention was directed to this wonderful work, either in America or England, consequent, doubtless, in great part, upon the discordant condition of the United States during the progress of the civil war; and in quarters where one would expect to find its proportions delineated, the barest mention occurs. The Union arch carries the Washington aqueduct over the Cabin John creek, the entire span being 220 ft., or 20 ft. in excess of the span of the famous Chester arch across the Dee in England, 68 ft. longer than the central arch of London bridge, 92 ft. longer than the noted bridge over the Seine at Neuilly, and 100 ft. longer than the arches of the Waterloo bridge over the Thames. The width of the structure in question is 20 ft., and the hight of the arch is 101 ft. The dimensions of this arch, therefore, eclipse those of any of the celebrated structures which are most commonly pointed to as wonderful achievements.

Drainage by Electricity.

The first extensive application of electricity for mechanical or engineering purposes is about to be undertaken in Mexico, in connection with the engineering operations already mentioned in these columns, having for its object the draining of the great water basin, in the center of which the city of Mexico is situated. The plan in brief is to establish on the western slope of the mountains, where the fall is great and rapid, a number of water wheels sufficient to develop some 20,000-horse power, and make them drive dynamo-electric machines of high electro-motive power. The current from these machines is to be conducted about 20 miles to a set of electric motors placed on the margin of the lake, and driving pumps, which will require about 7,000-horse power to work them. The water has to be raised about 40 ft. to clear the ridge, but once raised it has an uninterrupted fall toward the Pacific of several thousand feet, so that the descending water is made to add to the power required for keeping up the work. The whole apparatus constitutes what Mr. Maxim calls an "electric syphon." This plan obviates the necessity for extensive blasting operations, and, it is believed, will succeed, and thus relieve Mexico from the inundations that have damaged it so much for several centuries.

Underground Telegraph in Philadelphia. The work of laying the conduit for the underground telegraph system on Market street has now proceeded as far as Eleventh, east from the public buildings, and work is progressing at the rate of half a square a night. The conduits have 20 separate chambers. Each chamber has capacity for 50 wires, and connection is made by means of manholes, which are located at each square.

Useful Information.

How to Detect Adulterated Coffee.—*Food and Health* gives the following method of detecting adulterated coffee: Take a little of the coffee and press it between the fingers, or give it a squeeze in the paper in which it is bought; if genuine, it will not form a coherent mass, as coffee grains are hard and do not readily adhere to each other; but if the grains stick to each other and form a sort of "cake," we may be pretty sure of adulteration in the shape of chicory, for the grains of chicory are softer and more open, and adhere without difficulty when squeezed. Again, if we place a few grains in a saucer and moisten them with a little cold water, chicory will very quickly become soft like breadcrumbs, while coffee will take a long time to soften. A third test: Take a wineglass or a tumbler of water, and gently drop a pinch of the ground coffee on the surface of the water without stirring or agitating; genuine coffee will float for some time, while chicory or any other soft root will soon sink; and chicory or caramel will cause a yellowish or browning color to diffuse rapidly through the water, while pure coffee will give no sensible tint under such circumstances for a considerable length of time.

New Cooking Utensil.—The ordinary range of cooking-stove, in which the fire-box is placed at the side of the oven, or in which the products of combustion pass over the top, have the disadvantage of an irregularly heated oven. The sides and top are hotter than the bottoms and ends or other sides, and, as a result, the bread or other food is improperly cooked—perhaps burned at the top while badly done at the bottom. To correct this defect in ovens, a simple appliance has been devised for causing the air in the oven to circulate, and thus carry the heat obtained by radiation to all parts of the oven. A sheet of metal bent into the form of the top and on one side of the oven, is supported on wire standards and placed in the ovens. In the narrow space between the sheet-metal and the hot side and top of the oven, the air is heated more than the main body of the oven, and by expansion it rises and moves over the top of the oven, toward the cooler walls. The arrangement, simple as it is, appears to be founded on a good idea, and is reported to work well in practice. The apparatus examined was portable, and is designed to be put in the oven by the cook whenever an even heat is needed.—*The Century Magazine.*

Sea-Weed Sea-Serpents.—In a letter to the *Madras Mail*, on the use of gigantic sea-weed as a protective agent for shores, Capt. J. H. Taylor, the Master-Superintendent of Madras, gives the following interesting "sea-serpent" story: "A notable incident connected with this sea-weed is recalled to my recollection by Dr. Furnell's letter. About 15 years ago, while I was in my ship at anchor in Table bay, an enormous monster, as it appeared, was seen drifting or advancing itself round Green point into the harbor. It was more than 100 ft. in length, and moved with an undulating snake-like motion. Its head was crowned with what appeared to be long hair, and the keensighted among the affrighted observers declared they could see its eyes and distinguish its features. The military was called out, and a brisk fire poured into it at a distance of about 500 yards. It was hit several times, and portions of it knocked off. So serious were its evident injuries that on its rounding the point it became quite still, and boats went off to examine it and complete its destruction. It was found to be a specimen of the sea-weed above mentioned, and its stillness after the grievous injuries inflicted was due to its having left the ground swell and entered the quiet waters of the bay."

The First Compound Marine Engine in America.—The engine was a compound, working steam at 80 lbs. pressure, and the cylinders were arranged one inside of the other. The designs were by Erastus W. Smith, the well-known engineer of this city. It belonged to the steamboat *Buckeye State*, which was built at Buffalo, we think, about the year 1850. The engine was at that time a great novelty, and the boat ran for many years on Lake Erie. What became of her finally we do not know, and we make these facts public in the hope of eliciting from our friends in that section some more positive and decided details than we are able to give, ours being derived from a personal visit 30 years ago, to the boat itself. The visit was not prolonged, for, learning that 80 lbs. of steam were on the boiler, we found our time was very limited. We believe this to be the first compound marine engine used in this country, but will correct this statement if it is erroneous. —*Mechanical Engineer.*

How to Make Soluble Glass.—The following is the recipe generally employed by English manufacturers for producing that article by fusion in crucibles: Pure quartz, 45 parts; powdered alkaline carbonate, 23 parts; charcoal, 3 parts. Another recipe is: Quartz sand, 100 parts; caustic soda or potash, 48 parts; and charcoal powder, 5 parts. Or, washed quartz sand, 65 parts; anhydrous alkaline carbonate, 34 parts; and charcoal powder, 4 parts. The mixture is heated to redness, until entirely fused, and the contents are cast on tin plates for cooling, and finally crushed.

Tin in Preserved Food.—With reference to this question, the following information will be of interest: Last year, an English analyst, Mr. C. J. Wishart, detected tin in the juice of different fruits which had been preserved in tin vessels. A quantitative estimation of the amount of tin present in the syrups of various fruits sold in tin cans gave the following results: A 2 lb. tin of pineapples contained an amount of tin equal to 0.21 grain of stannic oxide (SnO_2); a similar-sized tin of green gages, 0.36 grain, SnO_2; of apples, 0.34 grain SnO_2. In addition to this quantity of tin, the first sample contained 0.39, the second 7.22, and the third 15.28 grains of ferric oxide. The two latter samples had a distinctly metallic taste. From examination of the inner surface of the tin can, it was obvious that the syrup of the fruit had acted upon the metal.

A Safety Envelope.—It is well known that an ordinary envelope may readily be opened by moistening the paper over the gum, after which operation, if done neatly, the contents may be noted, and the missive again sealed and sent on its errand. But a perfect "safety envelope" may be made by heating that part of the paper covered by the flap with a solution of chromic acid, ammonia, sulphuric acid, sulphate of copper and fine white paper. The flap itself is coated with a solution of isinglass in acetic acid, and, when this is moistened and pressed down on the under side of the envelope, a solid cement is formed, entirely insoluble in acids, alkalies, hot or cold water, steam, etc.

New Material for Flour Sacks.—A gentleman of Hartford has purchased an interest in the long wire belting patent, and will introduce the material to the grain and flour shippers of San Francisco and to the United States postal department. The material is a woven product with warp of fine iron or steel wire and filling of cotton yarn. Seamless bags can be woven of this material, which will be vermin proof for flour and wheat on the long shipment to Australia or to the western coast of South America, from San Francisco, and be an excellent substitute for the present canvas and leather mail bags.

Stains of oil paint may be removed with bisulphide of carbon; many by means of spirits of turpentine; if dry and old, with chloroform. For these last, as well as for tar spots, the best way is to cover them with olive oil or butter; when the paint is softened, the whole may be removed by treatment, first, with spirits of turpentine, then with benzine.

Good Health.

Is Insanity Increasing?

It is a common saying that an increase in the number of insane persons is one of the necessary results of the intensity of modern life. There is certainly a steady increase in the number of inmates in asylums for the insane—an increase greater than the growth of population would seem to warrant. For this there may be several causes:

1. An actual increase in the proportion of persons of unsound mind in comparison with the entire population.

2. A more general and systematic commitment of insane persons to asylums for protection and medical treatment.

3. A steady accumulation of insane persons owing to the better care of the insane and the consequent lowering of the death rate of such persons.

That the second and third causes are real and potent is amply sustained by the statistics of our public institutions. The proportion of insane persons at large naturally diminishes with the improvement and multiplication of asylums and the growing popular conviction that neither individual nor public well-being is furthered by allowing the insane to go free, uncared for, and without medical assistance; and as a natural result, the number of the insane in asylums increases proportionally.

Accordingly, we may have an increase in the number of annual commitments to asylums, as well as in the number of permanent occupants, without any increase in the total percentage of insanity in the country.

Increased efficiency in the medical treatment of the insane may also seem to increase the number of cases as well as the actual number under care at any time. With unskillful treatment, many cases of acute mania may result in speedy death, or what is worse, chronic insanity. In such cases, the patient counts but once. With better treatment the patient is ultimately, often speedily discharged, apparently or really well. The disease is liable to recur, however, and in the course of years, the same patient may have to be under treatment several times, each time adding one to the statistics of insanity.

Another fact which tells against the theory that "high pressure" living tends to enhance the mind may be found in the source of the larger portion of the inmates of insane asylums. The records of asylums show that most of the insane come, not from the busy professional, mercantile and manufacturing classes, but from those whose lives are a monotonous round of petty drudgery, or, what is equally killing, petty inaction, unfruitful idleness and dissipation. Frivolity probably leads more men and women to the insane asylum than the hardest and intensest pursuit of mental or material wealth.

Advice to Those Using Glasses.

Men engaged in literary pursuits should read most by day and write most by night. It is worthy of note that reading causes more strain to the eye than writing, and that copying work in writing makes a greater demand upon the organ of vision than offhand composition. Twilight and a mixture of twilight and artificial illumination should be avoided for any kind of work. The pale cobalt-blue tint is the best that can be employed when protection for the eye from intense glare is sought, as in the case of traveling upon snowfields in bright sunshine. The green glass that is often adopted for the purpose, is not by any means so worthy of confidence. Reading in railway traveling is objectionable in the highest degree, for a very obvious reason. The oscillation of the carriage continually alters the distance of the page from the eye, and so calls for unceasing strain in the effort to keep the organ in due accommodation for the ever-varying distance of the dancing image. The exact fitting of the framework of spectacles to the face and eyes is of more importance than is generally conceived. If the centers of the lenses of the spectacles do not accurately coincide with the centers of the pupils of the eyes, the consequence is, that the images in the separate eyes are a little displaced from the positions which they ought to hold, and that is somewhat painful and injurious effort has to be made by the eye to bring those images back into due correspondence for accurate vision. An incipient squint is apt to be in this way produced. Mr. Carter recommends that people should look to the centering of their spectacles for themselves. This may be easily done by standing before a looking-glass with the spectacles in their place. If the fit is a good one, the center of the pupil should then appear in the center of the rim. Fully-formed spectacles are always to be preferred to folding frames, because they permit of more satisfactory adjustment in this particular, and because they are more easily kept in the right position with regard to the eyes. The only advantage which the pebble enjoys over glass for the construction of spectacles, is the immunity which it possesses against scratching and fracture on account of its greater hardness.—*Edinburgh Review.*

The Value of Mental Tension.

A certain degree of tension is indispensable to the easy and healthful discharge of mental functions. Like the national instrument of Scotland, the mind drones wofully and will discourse most dolorous music, unless an expansive and resilient force within supplies the basis of quickly responsive action. No good, great, or enduring work can be safely accomplished by brain-force without a reserve of strength sufficient to give buoyancy to the exercise, and, if I may so say, rhythm to the operations of the mind. Working at high-pressure may be bad, but working at low-pressure is incomparably worse. As a matter of experience, a sense of weariness commonly precedes collapse from "overwork;" not mere bodily or nervous fatigue, but a more or less conscious distaste for the business in hand, or perhaps for some other subject of thought or anxiety which obtrudes itself. It is the offensive or irritating burden that breaks the back. Thoroughly agreeable employment, however engrossing, stimulates the recuperative faculty while it taxes the strength, and the supply of nerve-force seldom falls short of the demand. When a feeling of disgust or weariness is not experienced, this may be because the compelling sense of duty has crushed self out of thought. Nevertheless, if the will is not pleasurably excited, if it rules like a martinet without affection or interest, there is no *verve*, and, like a complex piece of machinery working with friction and heated bearings, the mind wears itself away and a breakdown ensues. Let us look a little closely at this matter.—*Dr. J. Mortimer Granville on "Worry," in Popular Science Monthly.*

Sweet-flag Candy.—Sweet-flag candy is relished by all lovers of sweetmeats, and it is a valuable aid to digestion, as it will stop the disagreeable rising of gas, so annoying to dyspeptics. Being eaten greedily by children, it is often better than other medicine. A bit held in the mouth when one is caring for the sick will often counteract the effect of contagious germs. To prepare it, take fresh, healthy roots of sweet-flag, and after a careful washing, cut in slices one-eighth of an inch in thickness. Put them into a stewpan or bright basin, and pour a little more cold water over them than will cover them. Set on the stove and heat slowly; when the water boils turn it off. If the candy is desired for medicine, quite enough of the strength has been removed, but for a sweetmeat it is better if boiled up and the water turned off four or five times. Now measure the sliced roots, and to each two cupfuls allow one and a half cupfuls of white sugar, turn on water enough to cover, return to the stove and simmer slowly, stirring often until the water has quite boiled away; then turn out on buttered plates, and stir frequently until dry. The long simmering after the sugar is added makes the roots quite tender, and the candy will keep nice and fresh for years.—*Country Gentleman.*

If the valley farmers succeed in stopping hydraulic mining, what is to become of the small mountain farmers who depend on the miners to furnish a market for the produce?

Passing Events.

The copious rains of the season have been of little service to miners, since in most places hydraulicing is temporarily prevented. Where it is not, however, the ditches have run full and the water been utilized. The Gold Run case is still continued at Sacramento, most of the testimony being as to the state of the rivers with regard to debris. Very little of interest to the miners' side of the question has yet been adduced.

Our "Mining Summary" will show what is going on in the various districts.

Our next issue will contain a great many valuable articles, and will be devoted mainly to the interests of Arizona and New Mexico.

Congress has re-assembled; the President has submitted his message showing peace abroad and prosperity at home; the Cabinet officers have presented their tomes of official wisdom, and now we are ready for the winter in Washington, which we trust may not be the "winter of our discontent," as often is the case while Congress pummels public affairs. California has no legislative turmoil this year, but next fall what a royal season there will be for the politicians!

THE Leadville smelters operated upon 3,600 tons ore during the month of October. Estimating the lead at 5c ₱ lb. and the silver at $1.12½ per ounce, the value of the yield for the month was as follows: $964,484.

New Gold Saving Apparatus.

Noah H. Falk, of Arcata, Humboldt county, Cal., has just received, through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent on a new form of gold-saving apparatus which is particularly applicable to the saving of fine or float gold and the particles of mercury also.

In an ordinary sluice is placed a grating or grizzly, through which the finer sand, gold, etc., fall into the undercurrent, and this undercurrent has also a screen, through which the finest sand and valuable portions fall into a common sluice leading them to a hopper, which is the commencement of the apparatus proper.

Just beneath this hopper is a horizontal table or plate, upon which the earth and water fall, and are by it divided and caused to flow off upon each side, where they fall upon two other plates which again subdivide the material and deliver it upon a screen. This screen separates the material into five streams, which fall a very short distance upon horizontal copper or amalgamated plates. The inventor thinks an inch and a quarter fall is sufficient to bring all the particles of precious metal into intimate contact with the plate without producing that tendency to "scour," as it is termed, which a rapid current or high fall will do. From this series of plates the material falls upon a second screen, through which it passes, and is received upon a second series of amalgamated plates also placed horizontally but a small distance below the screen.

This apparatus is all placed in a box which has an inclined bottom, over which the residue passes to a quicksilver trap, where the last remnant of gold may be saved, and from which the useless tailings will escape. The front or side of this box has an inclined hinged door, through which the plate may be removed to be cleaned up or examined at any time. This gate or door is kept locked, the plates being thus kept in a position where they cannot be examined or touched by outsiders.

The theory of the invention is that by thus subdividing the material and allowing it to fall a short distance upon the horizontal amalgamated plates, it will be brought into intimate contact with the surface, and will be caught and saved; and there will be no tendency to scour the plates.

Broadly, the use of distributer-screens combined with amalgamating plates and a quicksilver trap, is not new, but the specific construction and arrangement made by Mr. Falk is novel, and an "improvement" on this kind of gold-saving apparatus.

"Shotgun Dumps."

In some parts of California, along the Trinity river particularly, there are extensive areas of gravel lands or benches 100 ft. or more above the present river, probably the remnants of some great drift period. These are not connected, but lie upon points or heuches of land, their former continuity having been broken by land slides and creeks, which carry a flood bead of water in rainy seasons. Along the Trinity the mountain sides are steep, and not well adapted to the storage of water; therefore, the washing season is short. In order to economize water during the dry season, a singular contrivance is in use on the gravel lands near Trinity Center, which could no doubt be put to effective use in other localities.

It is locally called a "shotgun dump," but perhaps might be better described as an automatic discharge gate. A small, but deep reservoir is constructed at a suitable elevation above the bank to be washed, and the water from the ditch is conducted to it in iron pipes of four or five inches in diameter. At the lower end of the reservoir is a dam and a gate; across the dam is a beam, one end of which is attached to the gate, and the other, or lower end, has suspended to it a water box, with a valve in the bottom.

This box is suspended over the water flume, which carries the water to the mines. Water from the pipes is discharged into the reservoir. When it is full to overflowing the surplus water passes through a narrow box over the face of the dam into the suspended box, which is so gauged in size and weight, that when full it pulls down the beam and thereby raises the gate, permitting the instantaneous discharge of the contents of the reservoir with great velocity.

The valve of the suspended box drops upon an upright post; its waters are also discharged when the gate on the other end of the beam falls by its weight; the empty box rises and the process goes on indefinitely. This result is a sudden sluicing of the flumes at intervals of a few minutes with a heavy bead of water.

PRISON LABOR.—At a mass meeting held by the Trades Assembly this week, resolutions were adopted that the State Prison Directors' purpose of converting the penitentiaries of California into great manufacturing establishments was in violation of the spirit and intent of the Constitution, unjust to those who are endeavoring to establish mechanical industries on this coast, and likely to become a cause of oppression and degradation to the free white laborers of the State. A suitable protest was made.

Arizona and New Mexico.

Both these great southern Territories are now attracting a very large share of attention, not only of settlers, but of miners, capitalists, railroad men and others interested in developing the wealth of comparatively new regions. Railroad plans are being perfected, surveys made, roads built, and plenty of work is being done. People interested in agricultural pursuits are looking anxiously that way for the opening up of new sections where they may locate and where they will have transportation for their products.

The prospectors and miners, however, so far make up the bulk of the people now interested in these Territories. Arizona makes a glorious showing in the ranks of the bullion producers, and her mines are constantly on the increase both in number and yield. New Mexico is only now beginning to have any mining interests and her mines are not so well known. Yet there are large areas still unprospected and capital is now going in to help those who are developing the country.

We have from time to time given considerable space in our columns to articles descriptive of these two territories and their resources. Our next issue, Dec. 17th, will be devoted very largely to their interests. We shall print an enlarged edition of 24 pages, fully illustrated, and with a number of exceedingly interesting and valuable articles. We have collected considerable information of interest to the mining community, and can promise that our Arizona and New Mexico edition will be well worthy of perusal and preservation.

NEW TYPE OF LOCOMOTIVE.—The increase of local traffic between the Oakland wharf and Oakland, Berkeley, Brooklyn, and Alameda has necessitated the building of a number of new locomotives. Seven fine locomotives are now being built in the Central Pacific shops at Sacramento. The Sacramento *Record-Union* says: The frames of all are made, three have been set up, and one is nearly completed. They are of an entirely new pattern, and the plan of their construction is with a view of placing nearly the entire weight of the engine and tender upon the driving wheels, so as to give strong tractive power, and thus procure greater facility in starting and stopping the heavy trains of the Oakland lines. The real object sought is to construct the engines as to give them the utmost possible power in the way of making quick starts and stops while drawing heavy loads. To accomplish this no separate tender is used, but the fuel is carried upon the rear portion of the engine itself, which is extended back in the shape of a coal-bunker a distance of about seven feet, and which gives capacity for three tons of coal. The water tanks are placed upon the sides of the engine, and extend back nearly to the rear end of the coal-bunker. They will hold from 1,200 to 1,600 gallons. The engines are built double-enders, with a pilot front and back, so that they may be run forward and back upon the lines without changing ends. They are also arranged with accommodation couplers for high or low-built cars. The total length of each engine is about 40 ft. They stand upon six small drive-wheels, 50 inches in diameter, and with two leading and two trail wheels 26 inches in diameter. The weight is nearly all upon the driving-wheels, and will be about 50 tons when running.

SIXTEEN SIGNAL PROFESSORS.—A bill will soon be introduced in Congress for the betterment of the signal service, which provides for an increase of officers and men, and for the appointment by the President, with the advice and consent of the Senate, of three professors and 13 assistant professors, preference being given to those persons of high scientific attainment, especially in the science of meteorology, who, by long experience in the Signal Service and in the service of the United States, have shown a peculiar fitness for meteorological and allied science work.

DRIFTING VS. HYDRAULICING.—It costs from one to two dollars a cubic yard to work gravel by the drifting process. Experience has shown that the yield per cubic yard from some of the hydraulic claims in Nevada county in round figures is as follows: American mine at Sebastopol, 24 cents; Blue Tent mine, 15 cents; North Bloomfield mine, less than 10 cents; Milton mine, 33 to 47 cents; Manzanita mine at Sweetland, 27 to 33 cents.

JOHN SULLIVAN, a man employed in the Standard mine, Bodie, in going for a bucket of water, deliberately walked out of the 400-ft. level and fell to the 1100-ft. level of the mine. He was 27 years old, and this was his first day's work in a mine.

ARTHUR F. PRICE, son of Prof. Thos. Price, of this city, passed successfully at the annual examination of students of the Royal School of Mines, London, England.

The Chemical Composition of Slickens

The San Francisco citizens' committee which recently made an examination of debris destruction, brought back with them samples of slickens, which they submitted for analysis to Prof. Hilgard, of the College of Agriculture. Prof. Hilgard has made his examination and reported thereon to Mr. Gordon, Sec'y of the committee. What use the commities will make of the report, it will be for them to determine. As the subject is of great public interest, we have secured from Prof. Hilgard the privilege of looking over the results attained in his study, and the conclusions he draws therefrom.

After analyzing the samples of slickens furnished by the committee, Prof. Hilgard adduced the result of other analyses he had made of similar material obtained elsewhere, and compared them with a sample of alluvial soil from Dixon, Solano county. This sample of alluvial soil was taken because Prof. Hilgard had no complete analyses of the alluvial soil which underlies the slickens. This will, of course, be the proper comparison to make, to show how the covering of slickens compares with the rich soil which it has buried out of sight. Such a comparison will no doubt be made ultimately, but for the present the Dixon analysis is used. The following is a description of the samples and their composition.

No. 1. Sample of "slickens" furnished by Secretary of Citizens' Debris Committee.

No. 2. Clayey "slickens" from Alger's Bend, Feather river, furnished by Julian Le Conte, of the U. S. River and Harbor Survey.

No. 3. Mining slum covering adobe land near Mt. Pleasant, Tuolumne county, coming from the hydraulic mines of Mt. Pleasant and Montezuma. Furnished by Mr. John Taylor, of Mt. Pleasant.

All these samples are of a pale yellow or ochreous tint; Nos. 1 and 3 are tolerably easy to crush between the fingers, and contain scarcely any sand, being a close, fine silt. No. 2 formed hard lumps of very fine texture, and when exposed to the sun in the river bed, had formed great gaping cracks.

No. 4. Soil from Dixon, Solano Co. Sent by J. M. Dudley, Dixon.

	No. 1. Com. Slickens.	No. 2. Feather River.	No. 3. Mt. Pleasant.	No. 4. Soil Dixon.

*This is unusually low for an alluvial soil, 20 to 25 being common percentages.

Prof. Hilgard comments upon the above results as follows: First, as to the chief elements of plant food, as compared with the Dixon soil, and still more as compared to alluvial soils elsewhere, the slickens samples are deficient in phosphates and in potash, but all seem to contain a satisfactory, and even large supply of lime. In humus, however, and therefore in nitrogen, they are altogether deficient—so much so, that a quantitative determination was not attempted in the case of Nos. 1 and 2. No. 3 had been cultivated for some years, plowing in weeds, etc., and thus had acquired a small supply of humus, but less than half of what is ordinarily adequate in such soils. It therefore fails to yield paying crops.

This, in fact, is the "key to the situation." Considered only with respect to the percentages of mineral plant food present, the mine slickens materials analyzed would represent third-rate, and perhaps sometimes even a somewhat higher class of soils; but the absence of humus or vegetable mold leaves these ingredients in an unavailable condition. It is a crude, unthrifty material, and many years must elapse before this state of things can be changed by the slow processes of nature. Practically, the farmer having land covered with "slickens" of this kind, will, for some time to come, like the European cultivator, be subject to the maxim: "No manure, no crops." By diligent cultivation, green manuring, etc., such soil may, in the course of 15 or 20 years, become able to contribute something to the nutrition of crops from its own store of plant food. This, of course, refers to cases in which the finer materials have been alone deposited, and not accompanied by floods of sand or gravel, which at times forever destroy the value of the land.

It has sometimes been noticed that certain lands were improved by the flowing in of a coat of slickens that had covered the surface to the depth of a few inches. This may occur in adobe soils, whose tilth, and in the case of gray adobe, even intrinsic productiveness, may be furthered by such addition.

ANOTHER FOUNDRY.—A petition has been filed with the Supervisors by Nuttall, Bacon & Co., announcing their intention to start in the machine shop and foundry business on Fremont street, and asking permission for the erection and maintenance of a steam engine, boiler and cupola.

EWAN GRIFFITH, a Welsher, and who prospected the Yuba river to the forks—Downieville—and discovered diggings in the vicinity of the City of Six, Sierra county, and erected the first cabin at that place, died last week. Of late years he has been farming, and died very wealthy.

Lecture to Young Mechanics and Apprentices.

The following is a report of the lecture delivered in the hall at McNevin's Nautical School last week by Capt. Wm. A. Phillips:

The Properties of Steam.

The architect who undertakes to erect a building, or the mechanic who constructs an engine, without first obtaining a full knowledge of the properties and nature of the materials used in such building, is almost sure to fail; and the engineer who takes charge of a steam engine, or uses steam for any purpose in mechanics or manufactures, should first acquaint himself with its nature and properties. And in order that we may the more fully understand the nature and properties of steam, it may be necessary, in those few brief remarks, to touch upon its natural chemical composition and properties in a general way.

Water is looked upon by many as a common and simple element; and the mode of converting it into steam is known by every school boy of the present age. Not so with its constituents and properties when in the gaseous form. Analization of steam, such as is usually generated in the ordinary steam boiler, has yet to be made, and in consequence many vague theories and ideas are advanced.

Ice, water and steam are one and the same substance, only of different degrees of temperature. Then, evidently, temperature gives different properties to the same substance. The highest point to which ice can be raised and maintained as ice, is 32° F., but the highest to which water and steam can be raised, is not known.

We know that at atmospheric pressure water evaporates into what is known as steam, at 212°, and above or below that point in accordance with the pressure to which it is subjected, and in proportion to the units of heat applied. Steam and water can exist in their respective forms at all temperatures, above 32° F., and, in fact, steam is known to exist much below the freezing point. It may be necessary for me to say here that I make no distinction between what is called vapor and steam; in fact there is none, except temperature.

If the temperature of the air should fall sufficiently below that of the water in our bays or rivers, steam will be emitted from their surfaces, and become visible when condensed in the colder atmosphere. Steam can be condensed from the atmosphere by any cold substance being placed in it. A pitcher filled with ice will illustrate it.

Steam is emitted from our bodies at nearly the same temperature as the air. To prove this we have only to breathe on a piece of cold metal or glass, when condensation ensues and the water can be easily collected. When the atmosphere is much colder than our bodies this steam is made visible by condensation, and when the temperature is sufficiently low, has been frozen into ice upon the beard. I have said here that steam was made visible, but when visible it is no longer steam, but minute globules of water of infinitely small proportions, which, by their attraction for each other, under favorable conditions, form drops and fall in rain, or are evaporated again and carried off in the thirsty atmosphere.

Pure Steam

Is composed of two volumes of hydrogen and one of oxygen; or, by weight, one of hydrogen and eight of oxygen. If two cubic ft. of hydrogen and one of oxygen are united, they will form only two cubic ft. of steam, or a volume equal to that of the hydrogen and equal in weight to both. (Two parts of nitrogen and one of oxygen combined to form protoxide of nitrogen, produce the same phenomena.)

Steam is three-eighths lighter than common air. An atmosphere of pure steam would only weigh a little over nine pounds, yet water, of which it is composed, is 770 times heavier than air (although it is principally composed of hydrogen, the lightest gas known), it being in weight as 1, nitrogen 14, and oxygen 16. The fall of the barometer indicating a coming storm, also indicates an excess of aqueous vapor or steam in the atmosphere, the air being lighter by the amount of steam contained in it. Before passing further on this subject, it may be necessary to make a few remarks in regard to some of the

Instruments Used in Measuring Heat.

The thermometer, being the instrument generally used for measuring degrees of heat, might be more properly termed degrees of expansion and contraction in the liquid or metal used in its construction. Quantity of heat cannot be ascertained by it, although indicated by the expansion of the material of which the thermometer is composed, to be either more or less intense. Assuming that the metal or fluid used in its construction always expands in proportion for each degree or unit of heat, we have a measure, but not theoretically correct.

The Calimometer,

Or thermal pile, is the most sensitive instrument in use for measuring minute differences in temperature, and shows the sensitive action of heat upon electrical bodies. This instrument will not indicate quantity, but will indicate or detect the presence of heat, though insensible to the ordinary thermometer. You will observe the distinction between quantity and intensity.

The Calorimeter,

As used by Laplace, is a device for measuring quantity. It is simple, yet ingenious; it consists "of a glass vessel having two annular chambers, the inner one to contain the liquid or material to be tested; the other two chambers to contain pounded ice; the outer chamber of ice to prevent the action of the heat in the surrounding air from acting on the ice in the middle chamber." The quantity of heat is then obtained by the quantity of ice. The substance under test will dissolve in the middle chamber, and can be ascertained by the weight of water thus collected from the ice in the middle chamber; yet this will not give accurate quantity, as all the ice thus dissolved cannot be collected, a portion of the water being retained in the ice by capillary attraction, even though no heat were lost while conducting the operation. From such defect or imperfections arise the discrepancies of different experimenters; for example, "Watt gives the latent heat of steam at one atmosphere as 988°; at 10 atmospheres as 840°." Watts' rule or theory being that 1,200° is the total heat contained in saturated steam, and that as sensible heat increases latent heat diminishes. "Southern gives the latent heat as constant at 950° at all temperatures." "Lavoisier at 1,000°, Rumford at 1,009°, Regnault at 966°."

In measuring the quantity of

Heat Contained in Steam,

The ordinary thermometer is useless. An approximation to quantity is made by the following: One cubic inch of water generated into steam contains sufficient heat to raise the temperature of 5½ cubic inches from 32° F. to 212°, making in all, when condensed, 6½ inches of water at 212°; yet the steam only indicated 212°. Hence, if we multiply 6½ by 212°, and deduct the 32° contained in the 5½ inches of water, we will have 1,202° as the amount of heat obtained from 1,700 cubic inches of steam, or the amount necessary to evaporate one cubic inch of water into steam, yet the steam will indicate, by the thermometer, as having only received 108°, when, as shown by the above calculation, it has received 1,170°, and yielded up to the 5½ inches of water 990°.

If we follow the subject a little further, we will find that this heat was diffused throughout 1,700 cubic inches of space occupied by steam—and here quantity takes the place of intensity—each atom of steam requiring its unit of heat to hold it in the gaseous form; for if one atom should lose its required unit of heat, it would be no longer steam, but would become water, and perhaps carry several of the surrounding atoms with it to the liquid form. If we could compress the 1,700 cubic inches of steam into one-half its volume without loss by radiation or condensation, we would find an indicated increase of temperature of 38°, and it would continue to increase as the volume was reduced.

The same theory holds good in regard to air when compressed. Water at the boiling point (atmospheric pressure) cannot be made to indicate any higher temperature than 212°. No matter how intense the heat applied, an increase of ebullition is all indicated until the volume of water is all evaporated. It is during this period that the seemingly lost heat is carried off into the increased space occupied by the steam.

Dr. Black says that "the same phenomena or apparent loss of heat takes place whenever a solid melts as well as when a liquid boils; and, on the contrary, a precisely equal apparent heat is produced or restored when the same liquid solidifies or the same vapor liquifies." The same author found it required 10 times the weight of ice in water—14° warmer than itself—to melt it.

Rumford says that "steam contains heat enough to raise 10 times its own weight of water, 102°, or 102 times its weight, 10°." Water is the greatest absorbent of heat of any known substance. If we take equal weights of water and iron, and raise them to the same temperature, it will be found that the water contains 10 times the amount of heat.

The heat required to

Raise One Pound of Water One Degree

Will raise 4½ lbs. of air the same hight; again, if one lb. of mercury be heated to 160° and one lb. of water to 40°, and mixed or mingled together, they will give a temperature of 45°, but if the water be heated to 160° and the mercury to 40°, and mingled together, they will give a temperature of 155° The 5° taken from the water will indicate an increase in the mercury of 115° On the other hand, the 115° taken from the mercury will only indicate 5° in the water; showing that different bodies have different capacities for heat.

Water, although the greatest absorbent, is a poor conductor of heat. It can be boiled in a vessel only a few inches in depth and emit steam from its surface without materially increasing its temperature at the bottom.

Steam is an Excellent Radiator.

The ease with which it gives out its heat is of great annoyance to the engineer, and also of great service in the steam engine by its rapidity of condensation. Many devices have been resorted to to prevent its radiation, such as jacketing and superheating it in the boiler. Superheating has been applied in various ways, and the poor conductive property of steam makes it possible to have steam at different temperatures in the same boiler, unless a very active circulation is kept up.

If pure steam be superheated beyond the point of loss by radiation, it becomes subsaturated or surcharged with caloric and acts upon the iron of the boilers and engine with a deleterious effect. Oxydizing the same, when superheated or sub-saturated, its absorbing properties are increased, on account of its inclination to become saturated or attain its normal condition.

If expanded in a cylinder, it will take up a portion of the water that may have been formed by contact with the colder surface of the engine. When expanded, it falls in temperature, and it follows that the pressure being reduced, the boiling point is also reduced, which allows the greater portion, if not all the water so formed, to flash back into steam, it having obtained the same temperature as the steam at its highest pressure. A sudden ebullition, which sometimes produces what is called priming, is caused by the same law of pressure regulating the temperature of the boiling point; for water can be heated to any degree to correspond with the pressure applied of its own vapor, and might be so confined as not to evaporate at all.

In the "Cyclopedia of Useful Art," it is said M. Cagnard de la Tour made some experiments with steam. He heated water in a strong glass vessel, in a little over four times its own space, to a temperature of 700°, or nearly that of melting zinc, when which the experiment was prevented by the solvent power of the liquid becoming so increased as to attack any kind of glass. The solvent property of fresh distilled water is known to produce the brown substance found in pipes and on the tubes of boilers using it, causing what is termed

Pitting of the Iron.

This brown product by analization is found to contain 79% of the oxide of iron and 15% water, with 1% of silica. Steam having similar properties as that of the distilled water, when superheated, acts still more powerfully on the iron of the boiler, superheater or engine; and because of this corrosive property in surcharged steam, superheating to any extended degree has been abandoned by many engineers.

J. W. Nystrom, an eminent engineer, explains superheating thus: "In order to utilize the maximum effect of steam, it is not necessary to overheat it. After a pure steam is formed, that is, when all the particles and bubbles of water are evaporated, water which accompanies the steam in such a form has the same temperature as that due to the surrounding steam pressure, preventing it to vaporize, and when it passes through the superheater, the temperature is greatly increased, while the pressure remains the same.

Expansive Qualities.

"It being in connection with the steam room in the boiler, allows the water to vaporize, and a pure steam is formed. If particles of water with the steam is admitted into the cylinder part of the stroke and then allowed to expand, it is generally found that the end pressure does not come up to that due by theory, from which it has been pronounced that the expansive quality of steam does not follow that of a perfect gas; but if we know the cubic content of all the particles of water, and subtracted that from the cubic content of the steam, it might be found that its expansive quality is not so far from that of a perfect gas." He further adds: "It appears, also, that the expansive quality is diminished by overheating pure steam," but assigns no reason for the opinion. We desire here to call attention to the fact that the relative

Volume of Steam to Water

Is not the same at all pressures, or reduced in proportion to its pressure, according to the law of gases. For instance, if we take steam at 1,700 cubic inches to 1 of water (pressure of one atmosphere), at two atmospheres we should have only one-half that volume, and at four atmospheres, one-fourth the volume; at eight atmospheres one-eighth, or 212 5 inches, when in reality we have 251 inches at eight atmospheres; the increased volume being due to the increased temperature at those pressures.

Steam, like its mother element, being a poor conductor, makes it necessary to cause nearly all the atoms of steam to come in contact with the heating surface of the superheater to give it a uniform temperature; and to accomplish this, superheaters have been made with flattened tubes; others with angular pipes, and in every conceivable form; many of them acting as refrigerators when placed in the uptakes of boilers, from the low temperature in them and the frequent admission of large drafts of cold air when the furnace doors are opened. It may not be amiss to say here

What We Mean by Pure Steam.

It is the vapor of water, free from watery particles, all foreign substances or other compound gases than oxygen and hydrogen, and of a temperature equal to the pressure under which it was produced. Sub-saturated steam is that which has received a higher temperature than that under which it was evaporated, and it can be raised to any degree of heat the vessel will endure in which it is contained, its absorbing properties becoming greater with each degree.

The changing properties of water and steam by heat might naturally make us inquire

What is Heat?

Is it matter that can chemically combine with matter? If without substance, how does it combine with matter to change its properties.? Tyndall, the great author on this subject, says, "it has no substance;" he calls it motion—"atomic motion." And if it is so, increase of heat is simply increase of motion; but in melting ice or evaporating water into steam this atomic motion is peculiarly arrested.

If it were not so, why should not all fluids evaporate instantaneously when reaching the boiling point? However, in this subject it is enough to know its existence in steam, and that it imparts different properties to it at different temperatures, or "when the atoms have reached a certain velocity," as Tyndall would say.

(To Be Continued.)

Mining Affairs in Nevada County.

The owners of mines in this vicinity, says the Nevada *Transcript*, refuse to give the daily, weekly or monthly clean-ups for publication, and that is why Nevada City is not much thought of by capitalists abroad. Men who have money to invest in quartz mining naturally ask, "Is there any good-paying quartz mines in Nevada City?" When the answer is given them in the affirmative they say, "We never hear of regular shipments being made from any particular mine in that section." That ends the matter, for no one, outside of the owners of each particular mine, can give any positive information. If such mines as the Providence, Merrifield, Wyoming and a dozen others would permit the publication of each shipment, Nevada City would increase in prosperity, for capital would surely be attracted to our known rich quartz belt, and many mines that are idle now would change hands and be worked. There are really enough quartz mines in this vicinity to give employment to thousands of men, if they were only once opened. Our people have not got the capital to work them, and if no encouragement is given to capitalists to come here they are bound to stay away, and the mines remain unworked. The Providence, Merrifield, Wyoming, Nevada City and a number of others that we might mention will compare favorably with an equal number of mines on the coast. The shipments made by these companies are large, but are all owned by private individuals who do not care to have any one know anything about their business. They pay their bills promptly, and that is all they care to give to the public.

Robinson Mine.—A dispatch from Denver, Col., to the Amantia *Press* says: The truth about the condition of the Robinson mine has been so successfully concealed that the cause of its depression is now for the first time understood here. Considerable indignation is exhibited also at the open misrepresentation of the mine by local officials. It transpires that the rich ore has all been exhausted, and what is left does not pay to treat.

A Useful Paper.—The Mining and Scientific Press of Nov. 19th is an excellent paper, full of information that is valuable to everyone. It contains 10 pages of solid reading matter, besides several pages of advertisements affording references to the various mechanical pursuits and manufactories. Every miner, engineer and mining operator and intelligent mechanic ought to take this paper. It is published weekly by Dewey & Co., 252 Market street, S. F., at $4 per annum.—*Mariposa Gazette.*

Successful Porphyry Mining.—Henry Barnes, at a point a short distance north of where the old Mountain House formerly stood, between El Dorado and Shingle Springs, El Dorado county, has for some time been working the porphyry seams of that vicinity with much success. The pay has been more regular than is usual in such diggings, and at a comparatively trifling expense Mr. Barnes has taken out between $3,000 and $10,000.

John H. Kickham, one of the men wounded at the powder explosion in the Great Sierra hoisting works in Mono county, being evidently about to die for want of proper medical attention, was placed on a stretcher and carried by five men a distance of 11 miles, to Lundy, where a competent physician resided. The journey lasted from daylight until dark, and involved an ascent and descent over mountain ranges of fully 12,200 ft.

One of the first works for Congress should be to give Alaska a territorial government. The present difficulties of explorers and prospectors going there, are very great and vexatious. Nature has thrown obstacles enough in the way, and the Government should afford them every facility. There is a great future for that region, and men are eager to enter it.

The Nevada *Transcript* of Dec. 4th says: We saw at Phil. Richards' banking house yesterday a beautiful "brick" of solid gold, valued at $3,000, which had just been melted by J. J. Ott, the assayer. As usual, the owners requested no mention to be made where it came from.

There are 25 men working at the Mayflower mine in Bristol district, Nev. Add to this some 10 or 15 men prospecting and doing assessment work, you will have the full number of men working in the mines of that district.

About 20 miles north from Bridgeport, Mono county, in a locality known as the Sweetwater Mountains, quite an excitement prevails over the discovery of very rich and extensive silver mines.

The little three-stamp mill erected in Golden Basin district, Nev., cleaned up in 10 days' run, from 60 tons of ore, $2,052.

The Grand Central Mining Co. of Tombstone, Arizona, has paid four dividends, amounting to $200,000.

During the month of October the Iron Silver Mining Co. of Leadville produced $101,888.

THE FRANKLIN GIRDER!

BY FAR THE MOST ECONOMICAL OF ANY CONSTRUCTION MADE.

—o—

This new and economical Girder for Buildings and Bridges, made of any desired length and to sustain any required load, and guaranteed to be fully up to the sustaiuing capacity represented. The price of these Girders is ABOUT ONE-HALF the price of those of same length and same sustaining capacity in common use in this city. The value of this invention has been most favorably commented on in full by most of the scientific press of this country, as the SCIENTIFIC PRESS, *Scientific American, Railway Review, The California Architect and Building Review, The American Architect and Builder.* A Girder 25 feet long, made for 17-inch wall, with abont 2 feet of brick wall on it, is now in front of premises 231 First St., above Shot Tower. This Girder held on the top of the hrick wall now on it, 117 Tons and 1,741 Pounds of Railroad Iron, at the Pacific Rolling Mills, piled directly over and hetween supports, and it would have held, in the opinion of experts 200 tons, as the deflection was not a quarter of an inch helow the true arc. The foundation on which the Girder reatsd, settled 7 inches, so that the loading had to be stopped at the above weight.

The Price of these Girders, 25 feet Long, to Sustain 100 Tons as a Safe Distributed Load, $200.

THOSE IN COMMON USE NOW IN USE IN THIS CITY COST NOT LESS THAN $400.

And otber sizes in like proportion. Every Girder guaranteed to sustain the load as a safe one; the breaking load heing three times greater.

Prices for any Size and Sustaining Capacity given on Application.

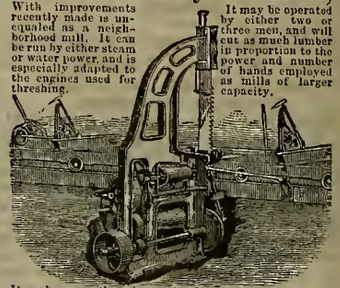
P. H. JACKSON & CO., Makers,
2 California Street, and 231 First Street, San Francisco, Cal.

P. H. JACKSON,
Civil Engineer.

PATENT RIGHTS FOR STATES FOR SALE.

Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.



It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.

It makes smooth and even lumber, leaves no stubshot, and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, prices, etc., to
CHANDLER & TAYLOR, Indianapolis, Indiana.

We also build the heavy Standard Circular Saw Mill, with either one or two saws as well as the Pony Circular Saw Mill that is capable of heing run with light power, We also build Stationary Engines of varied capacity; also, portable Threshing Engines.

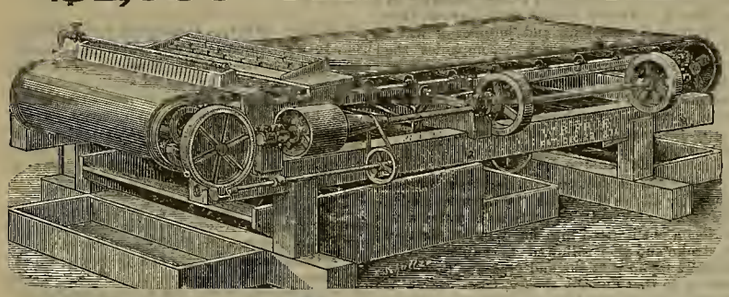
$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francieco, Cal.

Saves from 50 to 100 per cent. more than any otber Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by sids, for stakes of **$1,000** each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

COMPOUND OXYGEN — NOT A DRUG

A NEW TREATMENT for Consumption, Asthma, Bronchitis, Catarrh, Dyspepsia, Headache, Debility, Neuralgia, Rheumatism, *and all Chronic and Nervous Disorders.*

ACTS DIRECTLY upon the great nervous and organic centres, and *cures by a natural process of revitalization.*

HAS EFFECTED REMARKABLE CURES, which are attracting wide attention.

HAS BEEN USED BY Rt. Rev. John J. Keane, Bishop of Richmond, Va., Hon. Wm. D. Kelley, T. S. Arthur, and others, who have been largely benefited, and to whom we refer *by permission.*

IS STRONGLY ENDORSED: "We have the most unequivocal testimony to its curative power from many persons of high character and intelligence."—*Lutheran Observer.* "The cures which have been obtained by this new treatment seem more like miracles than cases of natural healing."—*Arthur's Home Magazine.* "There is no doubt as to the genuineness and positive results of this treatment."—*Boston Journal of Commerce.*

THE OXYGEN HOME TREATMENT contains two months' supply, with inhaling apparatus and full directions for use.

SENT FREE: a Treatise on Compound Oxygen, giving the history of this new discovery and a large record of most remarkable cures. Write for it. Address
Drs. STARKEY & PALEN,

ADMINISTERED BY INHALATION. 1109 and 1111 Girard St., Philadelphia, Pa.

Depository on Pacific Coast.

WE HAVE ESTABLISHED A DEPOSITORY OF OUR COMPOUND OXYGEN HOME TREATMENT at San Francisco, Cal. This will enable patients on the Pacific Coast to obtain it without the heavy express charges which accrue on packages sent from Eastern States.

All orders directed to H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., will be filled on the same terms on which we fill orders sent directly to our office in Philadelphia.

Patients ordering from our depository in San Francisco, should, at the same time, write to us, and give a statement of their case, in order that we may send such advice and direction in the use of the Treatment as their special disease may seem to require.

DRS. STARKEY & PALEN, Nos. 1109 and 1111 Girard Street, Philadelphia, Pa.

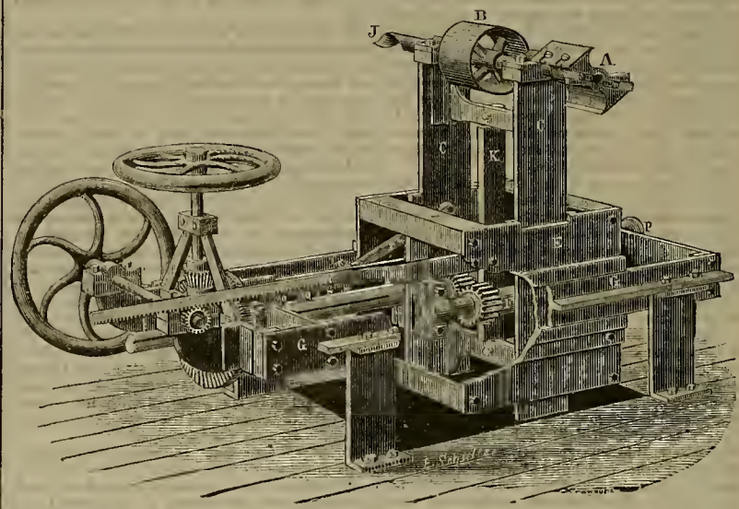
LEPLEY'S FRAMING MACHINE.



The above cut represents the Framing Machine invented by ISAAC LEPLEY, of Amador City, Cal. For perfection and rapidity of work it has no equal. Any form of cnt, tenon, mortise, gain or lovetail in timhsr of any sizs can be made with exactness, and as rapidly as desired. It is complete in all its parts, ready for the helt. The machine is simple in construction and can he run by anyone of ordinary ability. Every mine requiring timhsr, and all mills where much framing is to he done, should have one, as a matter of economy. It will do the work of twenty men.

GOLDEN STATE AND MINERS' IRON WORKS,
237 First Street, San Francisco, Cal.

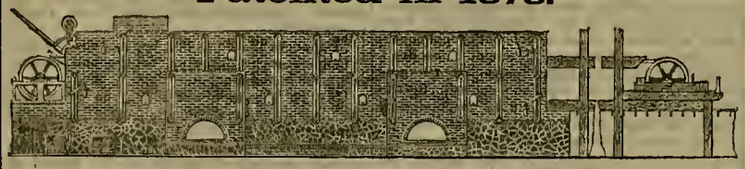
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

THE O'HARRA
CHLORIDIZING FURNACE.
Patented in 1878.



SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.
A cheap Furnace to build and to run.
The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.
At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.
At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61¼.
Lewis Chalmers, of the Isabella O. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenical sulphurate of silver up to from 84% to 95% of the assay.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING NOVEMBER 29, 1881,

250,191.—SAWING MACHINE—David Berry, Bolinas, Cal.
250,199.—DIRT PULVEIZER—Jos. H. Burd, Crows Landing, Cal.
250,137.—TIE FOR SUPPORTING HEADER JOISTS—B. F. Ellis, S. F.
250,261.—ORE CONCENTRATOR—S. Kendall, S. F.
250,070.—REGULATOR FOR STEAM PUMPS—H. Kessler, S. F.
250,275.—TWO WHEELED VEHICLE—S. W. Metcalf, Santa Rosa, Cal.
250,223.—GOLD SAVING APPARATUS—N. H. Falk, Arcata, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ORE CONCENTRATOR.—Stephen Kendall and L. W. Beauman, National Iron Works, S. F. Dated Nov. 29, 1881. No. 250,261. This is a percussion table concentrator. The improvements consist in providing at the upper end of the table a laterally extending depression or receptacle, provided with a removable perforated cover, the water being led into this receptacle by suitable means, so as to flow upward through perforations and onto the surface of the table, meeting the ore, which is moved toward the receptacle by the peculiar jar imparted to the table. The sulphurets, or other heavy concentrations which are caught in the receptacle or depression by dropping through the perforations, may pass off through a pipe or tube in the end of the receptacle; but the opening of the discharge pipe being a short distance above the bottom of said receptacle, the heaviest of the concentration, such as amalgam, floured quicksilver, etc., will remain in the depression and not pass off with the sulphurets. In this way a double concentration is effected at the one operation, the sulphurets being separated from the gangue, and the amalgam being separated from the sulphurets. This concentrator, which we have recently illustrated, is at work in several places, and is giving, we are informed, good satisfaction.

DIRT PULVERIZER.—Joseph H. Burd, Crow's Landing, Stanislaus county, Cal. No. 250,199. Dated Nov. 29, 1881. This invention relates to that class of agricultural implements known as "dirt pulverizers," the object of which is to thoroughly break up the soil to render it suitable for planting. The invention consists of a framework on which is supported a secondary frame carrying teeth, said frame having a vertical adjustment by means of a lever. Following these teeth is a roller forming the rear bearing or rolling gear for the device. It has on its surface a number of triangular teeth, which are intended to cut up the earth which the forward teeth have smoothed and scraped. A scraper set over the roller keeps the teeth of said roller clean, and appropriate scrapers keep the teeth in front clean. Minor details of construction complete the invention. The device is intended to follow any kind of a plow, pulverizing the dirt turned up.

TWO-WHEELED VEHICLES.—S. W. Metcalf, Santa Rosa. Dated Nov. 29, 1881. No. 250,275. This invention covers improvements in two-wheeled vehicles, and it consists in a novel manner of mounting or attaching the seat to the frame or body, the object of which is to overcome the forward and backward or jerky motion, communicated to the seat by the movement of the horse. It also consists in a removable rack attached to the frame, the design of which is to conveniently carry necessary articles. These improvements will be more particularly applicable to what are known as "breaking carts." The inventor has assigned interests to Phœbe Metcalf, Amelia Thompson and Helen Southwick, all of Santa Rosa.

SAWING MACHINE.—David Berry, Bolinas. No. 250,191. Dated Nov. 29, 1881. This invention relates to a new and useful device for sawing wood, and it consists of a main frame having a supplementary sliding frame containing a saw, which, by being moved back and forth with rapidity by means of a crank wheel, is caused by its own weight to cut through a piece of wood held suitably under it. There are minor details of construction for the complete operation of the device, but they would hardly be well understood without engravings.

THE Pioche *Record* says: Persons on the outside will do well to listen to our warning and not come to this vicinity in search of employment. There is a sufficient number of men here at present to do all the necessary work in and around the mines.

[Advertisement].

More About Water Supply.

The demand on us for information has recently become so great that we are unable to reply to the letters daily received, and we have thus found it necessary to publish this additional circular, and to provide the means for meeting the demands of those who desire wells for domestic, stock and other purposes. As a large demand for the *points* used in the construction of the driven wells has recently arisen here, it has occurred to us that many of them are being put down without authority or license. *The purchase of the point does not give the legal right to put down and use a well.* The driven well is the invention of Col. Nelson W. Green, of New York, and is secured to him by letters patent No. 73,425, No. 4,372 (re-issued) and No. 218,875. These patents have been exhaustively litigated in the U. S. Circuit Courts, in the States of New York, New Jersey, Massachusetts, Iowa and Minnesota, and in every instance decided in favor of Col. Green. Because of the immense value and utility of these inventions, combinations of large means and influence have been made at different times to defeat the collection of royalties and licenses. In one of these cases reported in 13th Blatchford, page 208, 19 days were occupied by the most able counsel in the argument, and over 3,000 printed pages of evidence and briefs were before the court on behalf of the plaintiffs alone, and the expenses of the suit were over $100,000. The opinion was prepared by Judge Benedict, and completely established Col. Green's claim at every point. Judges Dillon, Nelson and Blatchford have all rendered opinions to the same effect; and in a hundred other cases, arising out of collateral matters, have the title and right of Col. Green been most fully sustained. Our object in making these statements is to

Caution

All persons against the use of the driven well without authority, and to say that no person or persons have the legal right to put down or use a driven well in California without authority or license from us. We are the exclusive agent and attorneys of Col. Green, for the States and Territories west of the Rocky Mountains, and intend to enforce and protect his rights, as well as our own, to the uses and benefits of these patents. Should any person offer to put down a driven well for you, request him to exhibit his authority from us, and if he is not able to do this, you may rest assured that you will be required, sooner or later, to pay license to us.

To answer the constantly increasing demand for information, to guard against

Fraud and Imposition,

And to supply the orders as fast as they may arrive, we have made arrangements with the well-known house of

Huntington, Hopkins & Co.

To keep on hand all materials necessary for the construction of these wells, which will be shipped by them on receipt of the price stated. Upon the receipt of such order by them, or us as stated below, a full and minute letter of instructions as to the manner of constructing these wells, will also be sent, so that anyone of ordinary sense can put them down as perfectly as those especially engaged in the business. This letter of instructions—*together with the license*—will be sent with the goods. The articles sent will include everything necessary to a complete and perfect well, and also a pump of sufficient capacity to deliver 900 gallons of water per hour. Without this letter of instructions, and careful attention to the directions it contains, it is more than likely that the attempt to put down a satisfactory well would fail, and thus the goods furnished would prove a partial loss. In adopting these means of putting the driven well within the reach of everyone, the expenses of employing an expert, so called, are avoided, and the cost of the well is thereby so reduced as to be within the reach of everyone. One of these wells can be easily constructed by two men in two days—usually in one day—to a depth of 50 ft.

Where several wells are required in the same neighborhood, the work can be greatly facilitated by purchasing a few additional tools, costing not over $20. These may be returned to us, if not broken, and one-half of the purchase price will be refunded.

When desired, we will send an expert, for cost of transportation and $5 per day. Contracts for large water supplies will be entered into by us upon the most favorable terms—*upon the basis of success or no pay.*

Material for wells not more than 40 ft. in depth, including pump and license, will be sent for $45. Wells of 50 ft. will be supplied for $50, and for each foot over 50 ft., at 40 cts. per foot—to be sent, *in all cases*, before the goods are shipped.

In sending your order, it will be of advantage also to send us as full and accurate a description of the proposed location of the well, the distance—or supposed distance—of the water beneath the surface, the nature of the soil from the surface down—so far as known, the thickness of the different strata, and any other facts likely to be of advantage to you and us in writing our letter of instructions. In any case where, from the statement of facts, we are satisfied water cannot be obtained in satisfactory supply, we shall so state, and will immediately return your money.

We refer, by permission, to: Chas. Miller, Esq., of Huntington, Hopkins & Co., junction of Bush and Market streets; Lambert & Green, manufacturers of H. & L. axle grease, 144 Natoma street; M. P. Holmes, carriage manufactory, 327 and 329 Sutter street; Judge Robert Thompson, 76 Montgomery Block; R. H. McDonald, President of the Pacific Bank. All of San Francisco.

For circulars and other information, address BABCOCK, HOWARD & Co., 40 Merchants' Exchange, S. F., Cal.

NOTE.—No letter of instructions will be sent, except it is sent with the goods.

News in Brief.

THE Land League is being reorganized under the name of the Political Prisoners' Aid Society.

THE present winter promises to be a very active one as regards mining operations in southern Oregon.

THIRTY thousand tons of wheat have already been exported from Los Angeles county the present year.

E. H. SHOEMAKER has been appointed Assistant Superintendent of the North Pacific Coast railroad.

IT appears that $13,323,000 has already been expended on the Brooklyn bridge, and $3,000,000 more is necessary.

DURING the month of Nov., the receipts of the Harbor Commissioners' office from the wharves, were $45,396.31.

THE hooks, machinery, statuary and other movable property of the University, valued at $300,000, are being inventoried.

SIR JAMES PAGET, the eminent London surgeon, has been suffering from blood poisoning, which is attributed to vaccination.

SENATOR SAUNDERS recently introduced a bill to extend the northern boundary of Nebraska, to take in 600,000 acres of Montana.

A GOLD brick weighing $23,000 was received at Oroville last week, from the Spring Valley hydraulic company, the result of a partial cleanup.

FIFTEEN THOUSAND young salmon were turned loose in the Alameda and Laguna creeks, a few days ago, by direction of the U. S. Fish Commission.

DURING the rain of Sunday night a large fragment of the sandstone coping about two ft. in diameter, fell from the Mint building to the sidewalk.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and as a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

DEWEY & CO., Publishers.
No. 252 Market St., San Francisco, Cal.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
Press, Box 2361, S. F.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—San Mateo and Santa Clara counties.
C. E. WETMORE—Alameda county.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F.D., at this office.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

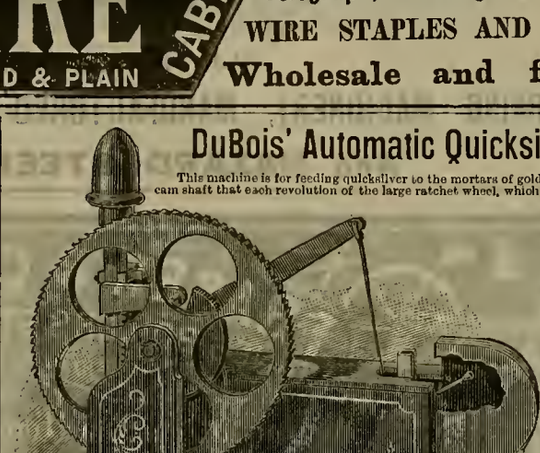
DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.

Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

ENGINE LATHES IN SECTIONS.

Limit of weight for 25-inch Lathes, 300 pounds. For 17-inch Lathes, 150 pounds.

READY WITHIN 10 DAYS,

Standard and Special Machine Tools.

SAN FRANCISCO TOOL CO., No. 21 Stevenson St., San Francisco.

AMERICAN EXCHANGE HOTEL.

Sansome Street, (Opposite Wells, Fargo & Co's Express), San Francisco.

This Hotel, under the management of CHAS. MONTGOMERY, has been thoroughly renovated, and being in the very center of all the Banks, Insurance Offices and Commission Merchants, it offers special inducements to Merchants from the Interior and Farmers.

Board, with Room, $1, $1.25 and $1 50 per day. Special rates by the week or month.

FREE COACH TO AND FROM THE HOTEL.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

KNIGHT WATER WHEEL.

All sizes of this Superior Wheel furnished at the shortest notice. Send for circulars to

ALMARIN B. PAUL, Agent.

Room 20, Safe Deposit Building, San Francisco, Cal.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

THIRTY-TWO PAGE EDITION.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, DECEMBER 17, 1881. VOLUME XLIII Number 25

A New Grinding and Amalgamating Pan.

Isaac Lepley and Wm. H. Hepburn, of Amedor, Amador county, have just received a patent through the MINING AND SCIENTIFIC PRESS Patent Agency for an improvement in amalgamating pans, which consists of an appuratus for imparting a peculiar motion to the muller by causing the upper end of the shaft to describe a small circle in addition to the rotation upon its axis, so that the muller will be revolved, and will also be caused to have a rolling motion upon the dies.

An ordinary pan with the usual dies, is used, and the muller with its shoes is driven by the ordinary vertical shaft, having a common band wheel and screen to raise and lower it. A bevel gear and pinion upon the horizontal driving shaft, under the pan in the usual way, give motion to it.

The horizontal bevel gear is secured to a short supplemental spindle which turns on a step, and has a peculiarly slotted opening in its upper end to receive the foot of the vertical shaft, which is corrugated or grooved to fit this slot, and forms a universal-clutch joint, so that while it will be rotated by the action of the gears upon the step, the upper end of the shaft may also be allowed a rolling movement, like that in a ball and socket joint.

In order to produce this movement of the upper part of the shaft, a case is formed in the upper part of the central line of the pan, and rollers are placed vertically within this case, so as to inclose the shaft between them. The ends of these rollers have pintles, which are journaled in guiding plates, and the rollers just fill the space between the sides of the case and the vertical shaft, so that as the latter rotates, they roll around between it and the case.

Two of these rollers are higher than the others, and they thus turn the vertical shaft out of a central line, and as it rotates, it will thus be caused to describe a circle with its upper end.

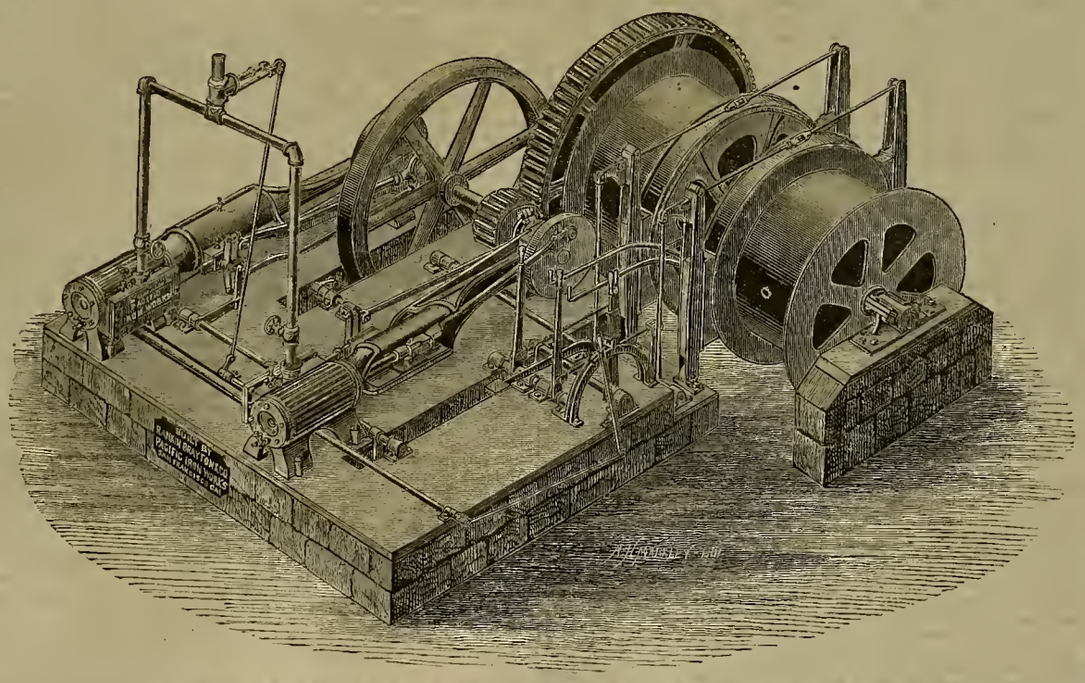
As the muller is carried by the upper end of this vertical shaft, it will also partake of this motion, and the result will be that the shoes upon one side will touch the dies or rims close to them, while those upon the other side will be lifted away from the dies. The outer edge of the muller will thus be given a rolling motion around upon the dies, so that the shoes are brought alternately into contact with the dies, while the muller is all the time revolving upon its own axis.

This peculiar motion tends to bring the pulp beneath every part of the muller, and to subject it to a thorough action. The same motion may be imparted to the muller in various other ways, as by the use of an eccentric sleeve instead of the rollers, or by other means, the object being to prevent the muller and dies wearing to a perfect fit, as occurs when the muller has only a plain horizontal motion.

THE hydraulic and placer miners of Siskiyou have begun operations by reason of the storm furnishing a supply of water. The quartz mills run by water power will also be started up in crushing quartz on hand.

Double Engine and Double Drum Geared Hoist.

The cut shown on this page is an improved style of mining hoist made by Rankin, Brayton & Co., of the Pacific Iron Works, in this city. It is intended for a double compartment shaft, and has a pair of link engines attached to one crank shaft. The drums are loose on the shaft and connected to same by clutches which slide on steel feathers. The spur gear is keyed to the drum shaft, which rests on supports fonndations. Each drum has a post brake, which is operated independently, by which means the



DOUBLE ENGINE AND DRUM GEARED HOIST FOR DOUBLE COMPARTMENT SHAFTS.

drums can be used together or separately, or one can be hoisting while the other is lowering, and both lowered without the use of the engines. A friction brake is also attached to the flywheel, giving ample brake power in any emergency.

Levers for brakes, reversing gear and throttle, it will be observed, are all under the control of the engineer at one point. Indicators are attached to each drum, and drums made for flat rope when desired. The gearing, levers, brakes and other parts subjected to strain are made extra heavy, and the material and construction are first-class in every respect.

This is one of the safest, most convenient and approved style of hoist now made, and has given great satisfaction wherever used. Made of two sizes—10x20 inch and 12x20 inch cylinders, and adapted to either vertical or incline shafts. The former will work to a depth of 1,000 ft., carrying the usual load, and the latter to a depth of 1,200 ft.

CANDELARIA.—A good many Cometockers, says the *Enterprise*, are making arrangements to go out to Candelaria as soon as the Carson & Colorado railroad reaches that point. With an adequate supply of water and swift and sure communication with the leading towns of the Pacific coast, Candelaria will become a lively place. Several of our people, who hold valuable interests in that region, are only awaiting the completion of the railroad to go out and commence operations on their claims.

The Mining and Scientific Press.

As we are nearing the close of the year, it is well to remind our regular readers that it is a good time to renew subscriptions, and it is also proper to call the attention of those who may be casual readers, to the fact that they also ought to help support a legitimate mining journal like the PRESS.

We have been publishing this journal for a great many years, and may be presumed to be pretty well posted in mining affairs, especially as they relate to this coast. We have been enabled by this knowledge and experience to save our readers many thousands of dollars in years past and will no doubt continue to do so.

The PRESS illustrates and describes all new processes, new mining inventions, machinery, etc., and keeps its readers thoroughly posted in all that is going on. We do not always wait for new things to be tried, but believe that miners and metallurgists are interested in experimental work and its results as well as in perfected appliances or processes. We have reason to know that this practice of the PRESS is appreciated by its readers.

As to the mining news of the day, we give it in a condensed form, readable yet concentrated, and free from all verbiage. Our mining summary is carefully compiled and edited each week and compresses in brief space the current news from a very broad area.

In a word, the MINING AND SCIENTIFIC PRESS is the best mining journal on this coast. It always gives full and complete information on all new things in its line, and will be found to be generally right in its conceptions of the merits of the various mining and metallurgical inventions that come to the front. Since the mining areas have widened, the mining papers have increased; but there are many which are only such in name, with no knowledge of mining matters outside of those which occur in the stock markets of the various cities.

The PRESS will continue to improve, and we hope to have received aid of our old readers and of new ones. As we said before, "this is a good time to subscribe."

The Hamilton Process.

Some few months since there was announced with great flourish, the invention of a new process for working ores, which was to "revolutionize the systems" in vogue. The inventor was Mr. Hamilton, and his invention was called the Hamilton process. It was to work ores in a peculiar manner, the use of a bath of melted lead being the principal feature, this melted lead being intended to do away with the use of quicksilver. The process was examined and said to have been endorsed by many so-called mining experts in New York—none of whom were ever heard of out here in the mining districts. It *was* thoroughly endorsed by several so-called mining newspapers in the East; papers so situated that their editors could have examined the process critically, had they been so inclined.

At the time the lengthy descriptions of the process were appearing in the various journals, the MINING AND SCIENTIFIC PRESS predicted its failure to accomplish the objects desired for the price named. It gave a history of lead bath processes, and the reasons for these not being generally used.

It has now transpired that the Hamilton process has turned out a failure. It is not only found that the process could not work ores for $1 per ton as was claimed, but that it cannot work them advantageously at all. It was as predicted; the experimental results were not borne out by trials on a large scale. The extensive works to be erected in New York will hardly be built.

Thus another is added to the long list of "process failures," which has brought the name of the "process men" into disrepute. This like many other processes has been tried on this coast, and now that the field is no longer a pleasant one, new regions are sought. In New York, where they think they know all about mining, a process will take better than here. We have tried most of these things here and the Eastern people are just taking primer lessons on subjects in which we have graduated. They have yet to go through the same experience that we did, and this is only one of the lessons to be learned.

GROUND lying to the westward of the Comstock is beginning to be looked after to some extent. This is probably because it is thought that the Sutro tunnel will make an advance in that direction as soon as it has completed connection with the Forman shaft. In the early days a good deal of prospecting was done to the westward of the Comstock croppings, but when bonanzas began to be found to the eastward all work to the westward was dropped.

THOS. HULLY, who has a water mill on Six-mile canyon, has bought the Lady Bryan waste dump, estimated to contain 50,000 tons of rock. This rock was dumped out in early times, and it is now thought that the greater part of it will pay for working. Mr. Hully has also leased the Rogers mine, Flowery, and will proceed to extract ore from the same for reduct at his mil

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

From San Francisco to Tombstone.

Cities and Towns along the Way—Yuma, Silver District, Volcanoes, Petrified Forests, Etc., Etc.

EDITORS PRESS:—On the morning of Nov. 17th we boarded the train of the Southern Pacific Railroad, for a trip through the southern part of the State and Arizona, specially in the intsrest of the MINING AND SCIENTIFIC PRESS.

Leaving the long wharf at Oakland, and ths "Metropolis across the Bay," hehind, we sped over the smooth rails in the magnificent cars of the S. P. R. R. Co. As ws ride along the bay shore we see the city on the left, Alcatraz and Goat Island in ths foregronnd, beyond which we catch glimpses of the great Pacific through the Goldsn Gate.

Aronnd the point to Port Costa with its huge transportation steamer—the largest in the world—Martinez is passed, Antioch reached, and we enter the valley of the great San Joaquin, up which the Southern Pacific follows to its head, throngh thriving towns and villages, the almost houndless valley stretching away on either hand.

On the right of Martinez, Mount Diablo holds its head; a mass of hill and mountain peak rose somher and grand, tearing the fleecy fog-clouds to shreds, and girding itself in vapory fsstoons.

A single patch of snow flecked the monntain summit on the north side, while roses bloomed in ths door-yards along ths way. Lathrop is reached, and the sound'ng gong summons ns to dinner at the Railroad Hotsl.

Resnming our seats, np the grand valley—the Egypt of California—we speed. The serrated, snow-capped peaks of the Sierra Nevada break on ths view. This line of mountain chain we are destined to follow to whers it sinks—in the San Bernardino chain—to a lsvel with the sea, on the confines of the great Colorado desert.

On the left the Diablo chain of the Coast Range rolls away toward ths south, the wids valley of the San Joaqnin hetween.

Plowing and seeding are the order of the day. Great piles of grain greet us at evsry station—indisputable evidence of the wealth and fertility of the vallsy.

Modesto—the bsautiful—is passed. Here ws sse ths evidences of the late conflagration in blackened walls and tottering chimneys. Here we cross the sparkling Merced, with its fringe of shady oaks and fruitful farms lining either bank. We pass Merced, with its grand hotel, and fine court and business houses, as the warm sun sinks hehind the westsrn range of mountains, and night casts its mantle of shadow over the plain.

As we approached the supper station ws wers startled to hear the brakeman call out, at the top of his voice, our name. We are pleased to leafn there is a town in the State—to which we emigrated in our hoyhood—of the writer's family name, even if they do spell it incorrectly.

Daylight found us rolling down the Solsdad canyon, (we were disappointed in not bsing able to visw that sxtraordinary piecs of sngi-nesring—the Loop in daylight) to the town of Newhall, situated in the San Fernando valley. The fields are beginning to assume their rohes of green under ths influenco of the recent rains.

At Los Angeles we breakfasu. Flowers are blooming in the gardens and door yards; their odor hangs heavy on the morning air. Promising ourssif to stop over at this point on our return, we roll ont of the city, hetween rows of tall eucalyptus trees, through groves of orangs and citron trees, past beautiful country residences. Golden fruits still hang hy ths wayside, and shadowy foliage obstruct the view. Clumps of forest trees and masses of cactus hegin to appear on either hand, with now and then a tall stem of the csntury plant. The conntry

Between Los Angeles and Colton,

Through which the railroad passes, is one of the most interesting in the State. Fine farms line the way; groves of orange, peach, citron and other fruits, topped hy tall encalyptus trees, in the midst of which the rose-embowered home pesps out.

The San Bernardino mountains ars on the right, the peaks high-lighted with touches of snow. Farm honsss dot the mountain hase, rssting on patches of verdure, and mark the spot where certainly dwells contentment. Colton rests in the vernal vale of San Bernardino, the mountains which hack it rising shruptly to a great hight, up which a road leads like a thread of light in ths distance.

Shortly after leaving Colton, the scene changes—we are approaching a different conntry from that just passed through, the farms and orchards of California ars heing left hehind, and ths

Desert of the Colorado

Anticipated in the change.

At Banning we commence the descent into the sea of sands. Down, down ws go until, near Dos Palmas, ws have sunk 263 ft. hslow the level of ths sea. A run of 160 miles over the great transcontinental railroad, which ths indomitahls enterprise of men of our own Stats has thrown over this ocean of sand, brings us to Ynma on the banks of the Colorado. Palm trees, of the fan variety, ars fonnd along the monntain hase on ths desert. Sand storms sweep the barren waste at timss, and hillows of sand hreak on the railroad harriers.

At Yuma we stop over, for ths purpose of visiting the Silver district, 50 miles up the Colorado on the Arizona side.

Fort Yuma,

On the California side, is situated on the top of a small granite hill, from which point a fine visw of the snrrounding country is ohtained. The river with its lins of willow, cottonwood and mesquite trees, and the distant rugged mountain chains, purple and desolate, make a cnrious picture. A fine hridgs [shown in our engraving, of this issne, EDS. PRESS.] spans the turhid waters. At the Arizona end stands the pavilion-huilt Railroad hotel where well cooked and well served meals are furnished the passsngers hy mine host, Weaver. Wide, douhle verandas sweep around the spacions huilding. Steam pumps furnish the hotel and cars with water from the river. The Territorial prison stands on the hlnff above ths town. Most of ths huildingsof Ynma, are adohes, with flat dirt roofs. The railroad huildings are suhstantial frame structures. Here commences the first division of the Arizona S. P. R. R. The town is situated nsar the junction of the Gila, in ths plain surrounded by sand hills. The climats in snmmer is warm, but at present is all that conld be desired. Althongh the 20th of November, we saw in a garden, near the S. P. ronnd house and shops, fig trees loaded with green and ripe figs. In ths same enclosure were a numher of hanana trees, thrifty and strong, which will bear fruit next year. This is an indication of what may be done in the futnre when the rich bottom lands of the river are hrought nnder cultivation.

Half naked Yuma Indians, stroll up and down ths streets, or go hy loaded with squashes and corn, from their farms across the rivsr. Stsamers lie along ths stream, and trains pass every few hours. Ynma is ths county seat of Ynma conuty.

The monntain range to ths north and east ars capped with domes and spires of rock, worn into fantastic shapes, hy the eroding elements. Groves of mesqnite, with ths long pod and peculiar screw hean, ahonnd along the river hottoms, which are held sacred hy the Yumas, who gather the heans for food, and cultivate a few fertile acres along the river. Flights of ducks go swiftly hy, and myriads of hlackhirds sing in the mesqnite trees. A hlue heron stands on a projecting sand har, gazing silently into the turhid waters.

Yuma is well worth a visit, and as a sanitarium, the mild, dry climate of its winter months make it a desirahle locality.

Silver District.

Next morning we took stage for the town of Silent. Our routs lay up the hank of ths Colorado. We crossed the Gila—quits a hroad stream at this point—a few miles above the town. At the ford, came suddenly upon some naked Yuma Indians—men and women, wading the river, laden with mslons and squashes. Dense groves of mesquite and willow linsd the road, the underhrush composed of arrow wood, from which the Indians make ths arrow shafts. Occasionally we passed scaffolds raised a few feet above ths ground and covered with hrush, places where the Indians deposit thsir store of mesquite heans. Thsss beans ars fed also to horses and other stock, the stage-driver informing us that his horses were partially fed on them. Canes grow along ths river hanks close to the water's edge.

Fifteen miles above Yuma, on the left of the road, we pass an extinct volcano called Boot Monntain, from its appearance to an npturned boot; the hlack hasaltic lava from this has run down across our road toward the river. This peak is the commencement of a snccession of volcanic peaks and hills which honnd the river on hoth sides. The hills are harren. The Palo Verde, Palo Ferrea, cat-claw mesqnite, Ocatilla and greasewood now appear in the dry beds of hroad arroyos.

The Giant cactus (*Ceres Gigantia*) or the Sagura, as it is called, now appears on ths harren hillsides, some of them standing 30 or 40 ft. high, like collosal sentinels guarding the desolate hills.

This ever curious and interesting variety of the genus *cactus* is met with all along the road. They appear to he hnilt on a hundle of small round sticks which extend from the hass to near the top. They are fluted hstween the sticks, and armed with terrihle thorns. The woodpeckers huild their nests nsar the top, consequently they are full of holes, from which the red headed builders look out.

Among the many wonders to hs found in this wonderful country—in this locality—are

The Petrified Trees,

Standing in an upright position, many of them with hranches still sxtending from the stone trunk. They are Palo Verde and Palo Ferrea trees. The solution of the prohlsm in regard to their petrifaction in this position, is, they have been covered with volcanic ashes during the volcanic epoch, and then silicified, after which event the ashes have been removed hy the eroding waters, and ths trees left standing. They look from a distancs liks the dried trunks of trees, and have been taken for such hy the prospectors in search of wood.

It is related of the discoverer that camping late near what he thought was a dry tree, hs was astonished to find in hreaking off a limb the tree was of solid stone.

At Castle Dome,

We dine. A steamhoat from Ynma is at ths landing, loading with galena ore from the Castle Doms mine 12 miles away. Ths ore is taken to Melrose, Alameda conuty, California, and used as a flnxing for other ores hy the Melrose smelting works; the company's stors and othsr buildings are locatsd at this place.

Castle Dome, a cupola capped mountain, looking much like a hugs hnilding, lies hsyond the mine from which it takes its name. Lines of monnment capped or serrated peaks and hroken hills lead off on eithsr side; towers, minarets and fantastic forms of rock, worn and woven into every conceivable shape, stand out with wonderful clearness against the hackground of azure.

There is a remarkahle clearness in the atmosphers of this region; ths distant monntain ranges nnohscnred hy haze or smoke, the vision seems to extend to an unlimited distance.

Dry arroyos, down which the monntain torrent rushes in the rainy season, lead up the volcanic slopes Ths rocks are gray and hlack hasalt, trachyte, tufa and volcanic ashes cemented hy water, porphyry, hut little or no sedimentary rock.

At night we reach ths littls town, or

Camp of Silent,

Abont fifty miles from Yuma. The town is located in what appears to hs a extinct crater ahout one mile hy one-half mils in diameter. The hills are harren, covered with a volcanic formation, the underlying rock heing syentic granite. The lodes are what are known as contact veins, and ars found cropping in most instances against ths walls or hills of granits, the foot wall hsing of that rock and the overlying or hanging wall of eruptive porphyry, trachyte or a calcareous tufa. The lodes all conform to the pitch of ths underlying granite, and at some points are quits horizontal. They appear to have been formed along the hottoms and up ths sides of the hasins, as thongh held in solution and gradually ccoled, leaving the slag collected in ths form of conglomerate croppings.

On the northwest slope of the volcanic crater or hasin is located the

Red Cloud Mine,

Which is an immense deposit of argentiferous galena and carhonats ores. Some chlorides and horn silver ars fonnd. The gangue is mostly calcite, fluor spar, with silicate of lime. Sulphide and sulphats of lead ars also met with. Beautiful specimsns of molyhdate of lead and vanadinite are ahundant.

The smaller veins of ths lead-hearing silvsr ore penetrats the spar gangue, following the forms of their crystals in zigzag courses.

The Black Rock has a large hody of ore of the same natnre and quality as the Red Cloud, and is located in the sams hasin, a mile or more from the Red Cloud.

Work is heing prosecuted on the Black Rock, hnt the mine and works of the Red Cloud are idle, and her smelter stands silent on the hanks of the river five miles away. Assessment work is heing dons on many of the other mines and prospects in the district, hut no ore is hsing rednced at present. Ths Black Rock contemplates smelting works ere long. If the ores of this district can he worked hy a system of concentration, they will prove to hs immensely valuable.

An arroyo cnts the west rim of ths hasin, and leads down to the river. A railroad, to carry ore to ths same, has heen snrveyed up the canyon, which has an easy grade.

Silent is correctly named. Its harren, silent, purple, verdnreless, rock-hound hills, echo no sonnd, except the hlast of the miners, and her volcanic slopes snpport nothing green, hnt from the top rim of the hasin we view the Rio Colorado, a hright line in ths harren hills, flowing grandly to the sea. GEO. MADEIRA.

Nuggets.

EDITORS PRESS:—Reading in recent numbers of your journal abont hig nnggets, I am reminded that I had the honor to hslp dig some nnggets out of the mines near the Middls Fork of the American river, in El Dorado conuty, not far from Volcanoville, and also to see others dig them out. Ths first of which I have any rememhrance was a smooth, flat piece, weighing $900, fonnd hy Henry Shattuck, in a small, dry gulch, close to the town named. Another piecs—long, flat and smooth—weighing $1,000, was found in a dry ravine, not more than 200 ft. from the first piece, in the same ravine. This was fonnd hy two brothers named Payans—John and Lemnel.

I, with these two hrothsrs, on a small ridge, not more than 50 to 100 ft. from the same claim, helpsd to get out $6,000 or $7,000, and the most of it was in piecss worth from $200 to $300 each. All of this we had hid in the flue of our stovs for a long time. Not far from ths claim there were several othsr nnggets found, and also in the snrrounding gulches from one to two miles away; hut I am not certain how many, nor who fonnd them, as so long a time has elapsed.

I, with a man named John Wishy, found a smooth, round piece, that was worth $310, on a dry ridge, not far from Slug Gulch, (called so from the hig pieces taken out of it) on the Georgetown trail to Volcanoville, on the south side of Otter creek. This piece I shoveled up on my shovel as I was shoveling out stones, and on ths same shovel and at the same time I got two other pieces weighing from six to eight ounces. These pieces were not got in ths ravins propsr, hnt on ths ridge closs hy, in an old ravine that had been filled up. All of this gold was found on a line nortb and south, and was from a vein of gold-hearing quartz that passsd along on this line, hut in many places was decomposed and lsft this gold.

Thsre was a man hy the name of John Mab that had a nugget of $300 which I think was taksn out in the same vicinity, hut I am not absolutely sure. I also helped to taks out of the same vein not more than half a mile from the little village hefore msntioned, some pure piecss in all supposed to hs from $80,000 to $100,000, one piece, in particular, that I helped to gst ont in the ravine sticking fast to the quartz, hut at least one inch above the stons so large that I could stand on the same with hoth feet. This piece was in the vein just below a small fall in the ravine of hut two ft. Ths water, as it fsll, struck direct on this piece of gold. The mine helonged to two, or rather to three men hy the names of Job Herin, Christian Rawl, and a man hy ths name of "Balty," so called hecause he was from Baltimors, his real name I do not remember, nor do I remember how hig or how much this piece was worth, hut to the hest of my memory it was worth from $1,200 to $1,500.

San Francisco, Dec. 7, 1881. J. H. STEWART.

Rice Growing.

EDITORS PRESS:—I ses that some ons up the country has hcen trying rice growing. I tried it once myself, in Los Angeles, insids ths city limits. I got the rough rics sent me from the west coast of Africs. There is a hull on rice which it is necessary to leave on whsn used for planting. Hulling rice destroys ths germ. In that tropical climate, 4° north, I saw it raised in abundance, and on the tops of the highest hills mostly. The natives clear off the land every time thsy raise a crop. Cutting down all ths brush and trash in the dry season, the sun soon drys it so that the whols patch is liks a brnsh heap, and so is all burnt over. This is just at the heginning of the rainy season. Then, with a little hoe, liks a short chissl, they give a little tap ahout an inch into the ground, and with ths other haud drop a fsw seeds into it; and as they still reach a little farther to strike, ths dirt flies back, covering it mostly about half an inch. Then coms the rains, and the rics starts and grows rapidly, keeping down other vegetation, till in ahout four months a heavy crop is ready to harvest, witbout any further cultivation. I thought it would do so here in California, and I think still it might, tbough it failed with me jnst as up the country. I had not sufficient water to keep it growing rapidly. I planted it in drills ahont a foot apart, and got it too thick. It grew rank, however, for a time, but having heen stinted for water, it grew hut ahout two ft., and after a while turned yellow, without throwing out heads. But I have always thought I could raise rics hy having plenty of water, like the rains of Africa, and not planting till the ground and weather was quite warm and using for the purpose the fonr warmest months in ths year. This rics hill does not require flooding. And I have heen informed that Carolina rics is not flooded so much on account of the rice as to kill the weeds. Ths rice, of conrse, needs plenty of water, hut it can stand to he covered for days, and weeds cannot.

H. H. MESSENGER.

Riverside, Pinal Co., A. T.

Harshaw, Arizona.

The little town of Harshaw over in the canyon don't look as if it amonnted to much, hut when you hegin to look around and ses what is heing dons in ths immediate neighborhood, one realizes very quickly that there is a rsason for stores well filled with goods, for hotsls supplisd with good viands, to say nothing of saloons with the hest of something good to drink.

The trade with Sonora from this point is hy no meaus small, and it is daily heing angmented. Then comes the Harshaw mines, with 80 men regularly employed and getting good wages as miners, with not less than 35 hands walking ahout the mill tnrning out $100,000 every month in hnlliou. This in itself will maks a pretty good support, hut that is not all. Ths French mine, under the snperintendence of Mr. Gallagher, has had a large force of men at work, and we understand will start with renewed vigor at once. Mr. Buckminster, Superintendent of ths Pool mines, has had instructions to make a critical examination of the Alta mins, with reference to putting a force of msn at work npon it. The Rsd Rock mins is reported to he honded for $40,000. Msn are at work on this mine, and the showing is excsllent. There is a 150-ft. shaft and considerable drifting done.

The Sonora hranch of the A. T. and Santa Fe railroad will pass within 15 miles of Harshaw in its passage through the Sonoita valley, which is one of the most prodnctive regions in Arizona.—*Arizona Journal.*

THE arrivals from the mining camps continus to throng to Salt Lake, and all the hoys recognize the advantages of housing np comfortably for the winter. It is much hetter than heing snowed under in ths hills.

MECHANICAL PROGRESS.

More About Water as Fuel.

Some of our Eastern contemporaries are somewhat excited just now over a revival of the oft repeated experiments in the direction of the disintegration of water and employing the liberated gases—hydrogen and oxygen in combination with liquid hydrocarbon for making steam. The present process is claimed as something new, and is known as the "Holland Process." The company owning it claim to have successfully applied it not only to stationary and locomotive boilers, but also to open fire-places for culinary and heating purposes. It is claimed through a correspondent of the Philadelphia *Record* that

Over Fifty Experiments

Have been made with a locomotive on the Brooklyn, Coney Island and Flatbush road, and the results are as startling to the public as they have been satisfactory to the inventors. An ordinary locomotive that had been in use for many years on the road was assigned for the purpose. The Holland apparatus occupied the place of the ordinary fire-box. Three hollow pipes took the place of the furnace bars, and from each side rose burner-tips at short intervals—352 in all. A floor of iron plates studded with open thimbles, through which the burner-tips rose to within half an inch of their openings, rested on the pipes. Four heavy iron retorts rested over the first 44 burners, and they received water, naphtha and steam through separate pipes, and when heated discharged their vapors by connecting pipes into the pipes under the floor and thence into the burners. In starting the fire a small tank filled with naphtha was first lighted and placed under one of the retorts. As soon as this retort was sufficiently heated to gasify the naphtha, naphtha-gas was burned under all the retorts and water admitted into them to be converted into steam. As soon as both water and naphtha were thus gasified, their gases were jointly admitted to all the burners under the whole length of the boiler, and

The Generation of Steam

Began in earnest; and as soon as it was feasible, steam from the boiler was introduced into the retorts instead of water, so that subsequently the naphtha only had to be gasified in the retorts. At the first of these experiments, two hours after the fire was started, the gauge showed a pressure of 20 lbs., and in 17 minutes more it went up to 40 lbs. and the engine moved out. Within 20 minutes afterward, the safety-valve was blowing off at 120 lbs. At the outset, the experiments were met by

The Remarkable Fact

That just in proportion as the heat increased the consumption of naphtha diminished. It took 13 gallons of naphtha to make the first 20 lbs. of steam, but only 12 gallons to raise the pressure to 120. The practical significance of this record speaks for itself in its exhibit of ample power for running a large passenger train 40 miles an hour, at an expenditure of little more than a quart of naphtha per mile. The scientific significance is found in the fact that hydrogen superseded naphtha as fuel in direct proportion to the heat in and around the burners and retorts. At 50 lbs. pressure steam was turned upon the naphtha, and the process of disintegration began. The hydrogen released from the steam, uniting with the oxygen of the air, produced an intense heat, and the steam itself was entirely consumed. When the heat was at its height, there was no visible sign of fire in the furnace box. *All was darkness*, proving conclusively that the burners emitted nothing combustible but pure hydrogen, whose flame is non-luminous. This is the point of proof the inventors desired to reach. Their theory is that, after steam has been introduced from the boiler and disintegrated, the oxygen consumes the carbon of the naphtha. The hydrogen, being left free, unites with the oxygen of the atmosphere, and gives out from its colorless flame

The Most Intense Heat that is Known.

The question of comparative cost in running a locomotive by coal or by water fuel, is of practical, if not of scientific, importance. Dr. Holland, from whom the process is named, estimates it at 78 cents for naphtha, where the expenditure for wood and coal would be $10. The expense of running a coal locomotive varies from 10 to 20 cents a mile, according to locality, while by the Holland process the cost would not reach 2 cents a mile. The large sums of money expended by railroad companies for handling coal and cutting and storing wood will also enter into the comparison. Besides, by the use of naphtha all damages resulting from fires started by sparks will be avoided, as the water fuel emits no sparks or smoke.

A Locomotive

Has just been completed for the Holland Company by the Grant locomotive works, at Patterson, N. J., which is specially adapted in all its details to the hydrogen process. It is finished and bolsted upon jackscrews, so that the fires can be lighted and the wheels set in motion. Externally it has the appearance of the ordinary locomotive, but it differs from it in the internal arrangement of the boiler and the fire-box. All the space usually occupied by the coal fire is utilized for getting up steam promptly and increasing speed.

Experiments have been conducted for some time in the manner above indicated; but the locomotive will soon be placed upon the road for practical work with its new fuel. The correspondent of the *Record* thinks it will be a perfect success. His opinion is also confirmed by Mr. Robert White, superintendent of the Brooklyn, Coney Island and Flatbush Railroad Co., who is a practical machinist and railroad man, says: "I am satisfied, from observation and my practical knowledge of the working of engines, that the hydrogen process

Will be a Success.

I watched it carefully while they were operating with the ordinary engine, and am fully convinced that with the boiler and fire-box they are now putting in the new engine, they cannot fail to make it a success. They made their experiments here with one of our own locomotives, and they told everybody just what they were doing, and how they did it, so that there could be no possible deception about it. I witnessed it all, and I am free to say that there can be no question about the result. At a cost not exceeding 15 per cent. of coal—if as much as that—they did all that a coal engine could do, and there was no smoke, cinders, sparks or ashes, nor any smell of naphtha."

The scientific (?) explanation of the "Holland Process," as given by the parties interested, are too lengthy for our columns at the present time. They seem to represent that some new principle relating to the decomposition of water, by which a vast amount of economy in the saving of heat over other processes has been discovered. We are unable to see it, notwithstanding the claims of the practical expert. If the new locomotive does really possess the advantages in point of economy claimed for it, they will doubtless be found due to the process of developing the caloric which is occluded in the petroleum, and not to the chimerical idea of disassociating water by the heat of burning petroleum and then uniting the separated gases by the heat of their own combustion, to once more form into their original element.

An Improved Loom.

A question is now being settled by a loom maker in this country which, if even moderately successful, will bring about one of the greatest revolutions in weaving—we mean fancy weaving—that has ever been accomplished in this or any other country; and yet this is a little matter of detail—it is not a radical improvement, as one might suppose, upon finding the dobbies working on the floor, or the yarn beam elevated 10 ft. in the air—anyone would notice either one of these changes as a radical departure from general practice.

It is the little things that are being watched now with the most care, with the greatest interest, and the manufacturers of the country to-day, as a rule, are more watchful, more careful, more interested, and paying closer attention to matters which interest them than ever before. They are judging machinery more by its absolute results than because it bears the name of a certain maker, and this is perfectly correct and proper—it should be so. In no department, we believe, has greater progress been made than in weaving fancy silks, fancy and figured cottons and fine grade high sleid goods, which replace those which have previously been imported from the looms of France and Germany, and yet we believe this fancy weaving is in its infancy here; it is certainly incomplete, it is not perfect, and whenever the American manufacturer starts upon an expedition of this kind, he is sure to go fully as far as any of his neighbors.

This improvement is a credit to American skill and perseverance, and it has been found to be a serious competitor with the looms and finishing machinery of the old world. We shall have more upon this matter soon.—*Boston Journal of Commerce.*

AN ENTIRELY NEW WATER WHEEL GOVERNOR.—One of the important points with all manufacturing enterprises, and especially cotton and woolen mills, is the perfection of speed of machinery, and while this point has been eagerly sought, it has only been approximately attained. All practical men know fully, and usually by experience experience, that too many of the governors, both of our engines and water wheels, are erratic and to a great extent unreliable. In a cotton mill, with everything running at a high speed, a little irregularity in the regulator is often a very serious matter, and it is also a hindrance to that perfection in the accomplishment of quantity as well as quality of production, aside from the absolute waste of material. Upon the looms much variation of speed means waste of material, curtailed production, and more or less breakage in the working parts, which require readjustment, repair, time and expense. Among water wheel users the regulator has not attained such perfection as among steam users. A radical departure in the line of regulators or governors has recently been made by a New England mechanic, which has been tested in some of the large cotton manufacturing concerns of the country for several months, and so far it has given unqualified satisfaction. A letter press description will not convey an accurate idea and he possessed of brevity. This attachment or machine, as it may be termed, has been patented, and is owned and built by J. P. Colline & Co., Norwich, Conn. They have already a number of these regulators at work.—*Boston Journal of Commerce.*

SCIENTIFIC PROGRESS.

Astronomical Progress.

Like the sand of the sea, the stars of heaven have ever been used as effective symbols of number, and the improvements in our methods of observation have added fresh force to our original impressions. We now know that our earth is but a fraction of one out of at least 75,000,000 worlds. But this is not all. In addition to the luminous heavenly bodies, we can not doubt that there are countless others, invisible to us from their greater distance, smaller size, or feebler light; indeed, we know that there many dark bodies which now emit no light, or comparatively little. Thus, in the case of Procyon, the existence of an invisible body is proved by the movement of the visible star. Again, I may refer to the curious phenomena presented by Algol, a bright star in the head of Medusa. This star shines without change for 2 days and 13 hours; then, in three hours and a half, dwindles from a star of the second to one of the fourth magnitude; and then, in another three and a half hours, reassumes its original brilliancy. These changes seem certainly to indicate the presence of an opaque body, which intercepts at regular intervals a part of the light emitted by Algol.

Thus the floor of heaven is not only "thick inlaid with patines of bright gold," but studded also with extinct stars; once, probably, as brilliant as our own sun, but now dead and cold, as Helmholtz tells us our sun itself will be, some 17,000,000 years hence.

The connection of astronomy with the history of our planet has been a subject of speculation and research during a great part of the half-century of our existence. Sir Chas. Lyell devoted some of the opening chapters of his great work to the subject. Haughton has brought his very original powers to bear on the subject of secular changes in climate, and Croll's contributions to the same subject are of great interest. Last, but not least, I must not omit to make mention of the series of massive memoirs (I am happy to say, not yet nearly terminated) by Geo. Darwin, on tidal friction, and the influence of tidal action on the evolution of the solar system. I may, perhaps, just mention, as regards telescopes, that the largest reflector, in 1830, was Sir W. Herschel's, of four ft.; the largest at present being Lord Rosse's, of six ft.; as regards refractors, the largest then had a diameter of 11¼ inches, while your fellow-townsman, Cooke, carried the size to 25 inches, and Mr. Gruhb, of Dublin, has just successfully completed one of 27 inches for the Observatory of Vienna. It is remarkable that the two largest telescopes in the world should both be Irish.—*Sir John Lubbock, in Popular Science for December.*

CONDUCT OF PALLADIUM, RHODIUM AND PLATINUM IN A GAS FLAME.—Theodor Wilm has found that, when the double salt of palladium chloride and ammonium chloride is decomposed carefully in a small porcelain crucible over an ordinary Bunsen burner, and the residue ignited after all the ammonium chloride has escaped, the metal turns a copper color and black, while black rings and spots are formed around it, which creep up the inner walls of the crucible, covering it more and more, and if the crucible be ignited with the cover loosely laid on, there is formed between the cover and the upper edge of the crucible a cauliflower-like growth of carbon. This carbon is not burned up by further ignition, even in an open crucible. This phenomenon has nothing to do with the formation of a compound of palladium and carbon, but consists simply in a decomposition of illuminating gas by the metal and a separation of carbon, which, however, is deposited mostly on the crucible in the neighborhood of the metal, but not on the metal itself. Rhodium conducts itself quite differently. Only a trace of carbon is deposited on the crucible, but the metal itself is markedly changed, a compound with carbon being apparently formed. Platinum conducts itself unlike either of the two metals mentioned. Like palladium, it sets free the carbon of illuminating gas by simple contact, but the carbon is then deposited in the pores of the metal and does not enter into combination with it. It appears from these observations that the presence of palladium and rhodium in platinum vessels is objectionable. Platinum crucibles, into the composition of which these metals enter, soon become blistered or perforated, while vessels of pure platinum do not suffer from long continued use.

THE AZTECS.—Prof. Stapheneon, of the Hayden surveying party in New Mexico, is charged by a Chicago paper with describing the Aztecs as an extinct race that never existed. He says they are a myth, and that the tribes known as the Cliff-dwellers are to be credited with all the romance attached to the Aztec name. New Mexico is full of their buried towns and cities. During his summer's work in New Mexico Prof. Stapheneon made a number of valuable collections, including skeletons and remains of extinct animals. Among his trophies are two gods of Egyptian character, with finely-cut features, outstretched wings, and traces of paint on their faces. The professor brought away specimens of pottery bearing a close resemblance to that unearthed in the ruins of the Old World, and also secured the secret of its manufacture from the Indians, who still make it in New Mexico.

ELECTRIC CONDUCTIVITY OF MOIST AIR.—Some electricians have held that humid air acts as a conductor of electricity; and others, notably the Count du Moncel and M. Gaugain, have maintained that it does not. Recent experiments of M. Merangoni support the latter theory very decidedly, for he finds that a Leyden jar heated so as to prevent condensation of moisture on its glass walls and thus arrest surface conduction, gives a long spark as in the driest air. When, however, the precaution of heating the walls of the jar is not taken, the moisture condenses on the latter, and forming a thin film of water, causes a silent discharge which might be mistaken for a slow discharge through the conducting air. It follows from these experiments that the loss of electricity on telegraph lines is wholly due to surface conduction over the wet and dirty insulators or leakage along entangled threads and branches of trees at particular points, and not to a general discharge into the saturated air.—*Scientific American.*

FORMATION OF ICE.—Pure water freezes at 32° Fahr., but if any compounds be dissolved in the water, these prevent it freezing at that point and lower its freezing point. Also water containing dissolved air or other gases does not freeze till these are first expelled. By boiling the water certain salts, such as the carbonate of lime, are precipitated and the gases expelled, thus leaving the water to freeze at a higher temperature than before, and at a quicker rate. The ice produced is harder, because it is free from air bubbles. These are produced in the rapid freezing of unboiled water thus: The upper surface of the water being frozen, the lower surface commences then to freeze, but before doing so it begins to part with its contained air. This air is prevented from rising to the surface by the film of ice already formed, hence it remains below in small bubbles, and ice forms around it. Such ice is of course more brittle than that which is free from these bubbles of air.

FINE RULING—ONE MILLION LINES TO THE INCH.—Mr. G. Fasoldt says, in a letter to the *American Journal of Microscopy:* I have ruled plates up to 1,000,000 lines to the inch, one of which was purchased by the U. S. Government at Washington. These plates show lines truly and fairly ruled, as far as lenses are able to resolve, and above this point the *spectral* appearance of the bands in regular succeeding colors (when examined as an opaque object) shows, beyond doubt, that each hand contains fairly ruled lines up to the 1,000,000 band. I do not believe I will ever attempt to rule higher than 1,000,000 lines to the inch, as from my practical experience and judgment, I have concluded that that is the limit of ruling.

THE ATOMIC WEIGHT OF PLATINUM.—Hitherto the atomic weight of platinum has been considered greater than that of gold; but according to the "periodic law" it should be less. K. Seubert has recently made a new and careful determination by which he finds it to be actually less, gold being 196.2, he finds platinum to be only 194.46. So that hereafter platinum will take the place which would be accorded to it if its properties were taken into consideration, and the atomic weight of the three metals leading in value will stand as follows: Iridium, platinum, gold.

THE YOUNGEST SCIENTIST.—Probably the youngest man in the world who has attained scientific celebrity is Frank Hatton, the son of Joseph Hatton, an English novelist and journalist. Frank, though but 20 years old, is the leading British authority upon the action of gases on bacteria, and has carried off the Franklaud prize for the best original investigation involving gas analysis. This talented youngster has been sent out to North Borneo and the Maylay Archipelago on a scientific and mineral exploration, this probably being the first instance on record where so important an enterprise was intrusted to a stripling.

THE composition of buckwheat has been examined by M. G. Lachartier. He states that the proportion of mineral matter in the straw increases with the weight. The straw may indeed become richer in phosphoric acid than the grain, differing thus completely from that of the other cereals. The straw of a crop of buckwheat may contain more mineral matter than does the grain. The sum of the principal fertilizers removed from the soil by an entire crop is much more considerable than for a crop of wheat containing the same quantity of grain.

INSECT SOUNDS.—Although considered mute, insects have power of producing sounds by certain movements, which, to some extent, are characteristic of the different species. The shrill chirp of the cricket is produced by the rubbing together of the wing cases. The harsh shriek of the grasshopper is caused by friction of the legs against the wings. The shrill trumpet sound of the mosquito and the busy hum of bees and flies result from the rapid motion of the wings while flying.

PROPOSED ELECTRICAL EXHIBITION IN LONDON.—An effort is being made to secure the holding of an International Electrical Exhibition in Crystal Palace, London, during the coming year. The prospects are said to be good, many of the exhibitors at Paris having agreed to contribute.

Tombstone.

Arizona's Leading District.

Ths Tombstons *Epitaph* has been pnblishing an excellent series of articles on the mines of that district, and in conclusion gives a final summary showing ths result of three years' work. It says:

It will bs rsmsmbered that the first mill—ths Gird mill, of the Tombstons Mill & Mining Co., started up witb ten stamps, dry crushing, in June, 1879. This was ths commencement of that flow of hullion that has since been stsadily on the increase until ws can look forward with surety to the time when it will exceed $1,000,000 per month and the dividends one-balf that amount.

Tombstone M. & M. Co.

From June '79 to Jan. '80, bullion product	$ 239,540 00
From Jan. 1, '80, to Jan. 1, '81, bullion product	914,389 60
From Jan. 1, '81, to Nov. 1, '81, bullion product	1,308,914 00
Total product for 27 months	$2,462,843 60

Dividends—Dividends during 1880, ten of $50,000 each; dividends to Nov. 1, 1881, ten of $50,000 each. Total amount of dividends to Nov. 1, 1881, $1,000,000.

Originally the Lucky Cuss and other mines that now helong to this company, were owned hy the Corhin company, snd worked to a limited sxtent, producing, all told, $40,000, for which ths consolidated property, as it now stands, is to he credited. This swells the hullion output of the mines of the Tombstone Co. to $2,502,843.60. As no part of the Corhin Co. product went into the fund from which the dividends were paid, it does not show in the above table.

The yield for 1879 and 1880, amounting to $1,153,929.60, came from the reduction of 19,350 tons of ore. This was an average of $59.63½ per ton.

The yield for ten month of 1881, amonnting to $1,308,914, came from the reduction of 17,650 tons of ore. This was an average of $74.16 per ton. Total ore worked 37,000 tons; average yield per ton for whole amount $66.56½. This excludes the Corhin output of $40,000 which is the product of an unknown quantity of ore.

Grand Central.

From March 10, '81, to Nov. 1, '81, bullion product	$348,176 46
Total amount of four dividends paid	$200,000
Paid first cost of mill, hoisting works, and developing mine	300,000
Total	$500,000
Ore worked, tons	18,000
Average per ton	$47 12½

Head Center.

From April 15, '81, to Nov. 1, '81	$156,520 52
Ore worked, tons	5,876
Average per ton	$26 80½

Vizina Consolidated.

From Oct. 1, '80, to Nov. 1, '81	$424,693
Dividends paid	20,000
Ore worked, tons	4,504
Average per ton	$92 44½

Boston Mill.

Product	$88,983 33
Tons of ore worked	1,906
Average per ton	$46 68⅔

Note.—This mill has worked all the Vizina ore, and that represented in this table is the aurplus that came to them in small lots from various miues in the district, which accounts for the apparent small product of the mill. The actual ore worked by the mill was 6,500 tons, giving a total yield of $513,676.33.

Western (Contention) Mining Company

From March 8, 1880, to Dec 31, 1880, product, $1,213,975.57	
From Jan. 1, 1881, to Oct. 31	1,223,168 82
Total	$2,437,144.39
Dividends paid	$1,375,000.00
Ore worked, tons	35,016
Average per ton	$69.60

The first year's outpnt of $1,213,975.57 came from ths reduction of 15,000 tons of ors, being $80.93 psr ton.

This year's product of $1,223,168.82 came from ths reduction of 20,016 tons of ore, heing $61.10 per ton.

Recapitulation.

PRODUCT.

Tombstone company, official	$2,462,843 60
Corbin, official	40,000.00
Grand Central, official	348,176 46
Head Center, official	156,520.52
Vizina, official	424,693 00
Boston Mill, official	88,983 33
Western, official	2,437,144 39

Ingersoll, estimated	150
Sunset, estimated	300
Total	103,442
Average per ton	$62.70

Concluding Remarks.

In our former articles and the foregoing, we have confinsd ourselves atrictly to official statements given us hy the superintendents of the various mines, with two excsptions, the Ingersol and Sunset, and those we have estimated safely within bounds. The valne of these figures, we trust, will prove as great to the public as the labor has been hard to us in their collection, compilation and publication. We now have a common atarting point for future bullion atatistics, dating from Nov. 1, 1881.

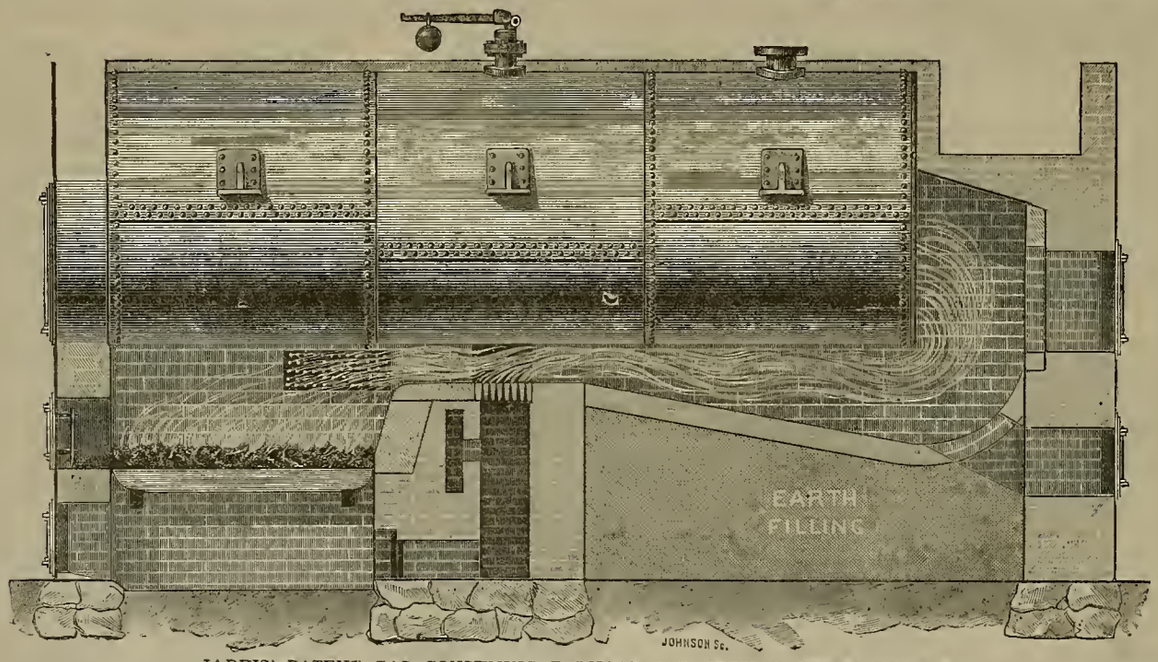
The aggregate showing will no donbt rather stagger those San Francisco and Nevada experts who have, almost to a man, reported unfavorably upon Tombstone mines. Long before this, according to their estimate, our mines ought to have been worked out and the district abandoned. It is well remembered hy our old residents, that all the mines, including the Contsntion, owned hy the Schieffelin Bros. & Gird, were at one time honded to parties in the interest of Geo. Hearst, Haggin and Tevis, for the sum of $90,000, and that Hearst—of whom we have heard it said "George never makes a mistake"—is reported to have examined the property and reported unfavorably, and allowed the hond to elapse. It is hut fair to state in this connection that Mr. Hearst now says that with him it was a simple business proposition; that he thought he could get the property for less money, therefore he allowed the bond to go by default. Be this as it may, the uniform opinion of Comstock experts has been adverse to our mines, and even to-day hut little western capital is heing invested in them. Many think this a great loss to the place, aaying in defense of this opinion that had Comstockers hold of the mines, work would be pushed with more vigor, more men would he employed, more hullion turned out, and all would end up with a grand atock "hoom," and everyone wonld have a chance to make some money. We grant that were the mines worked after the Comstock fashion, timea would he lively here and there would he an ephemeral growth in the town, soon to be followed hy a reaction similar to that in Virginia City to-day. There would he the same opportunity for the public to gamble in stocka that there was in the Comstocks and the hard-earned money of the publio would he raked into the coffers of the manipulators with the same certainty that followed each successive "deal" in San Francisco during the last 20 years.

Under ths nressnt conservative systsm of management, ws know that there are reserves of ore already dsveloped in the mines mentioned in thess reports to last for years, and havs reason to hslieve that when all their ground has been explored, other and equally good bodies will bs opened up, thus keeping up a steady yield of hullion for the next 20 years, and, for aught anyone can tell, for a century. With the new mines coming into prominence, it is a safe prediction that, ers five years havs rolled the sands of time iuto eternity, Tombstone will have acquired a permansnt population of 15,000 or 20,000 souls.

With the introduction of an ample water snpply, which is now assured beyond a peradventure, the mills will he removed from the San Pedro to the minss, and other new and larger mills will bs erected, whsrshy all ores returning $10 per ton can he mined snd milled without loss. Thers is known to hs millions of tons of ore thus far untouched that will yield in sxcess of that amount; thsrefore, ths doubt as to the fnture is solved in favor of a long and prosperous ons.

Jarvis' Patent Gas Consuming Furnace for Setting Steam Boilers.

The furnace which is shown on tbis pags, is a practical application of the Siemens' gas regenerative furnace to ths ordinary setting of steam boilers; also to the heating furnaces for smelting ores, and all kinds of furnaces aet in brickwork. It is adapted to the best and cheapest fuel, and will burn green wood, screenings, wet peat, tan hark, wet hops, spent sugar cane, dyewoods, waste of fruit packing, and any other kind of waste containing combustihles, without a hlast, effecting a saving of from 20% to 40% over the ordinary furnace, as demonstrated by many tests, and in a great measure obviating the nuisance of smoke and soot. We are informed also that it has no injurious effect on the boiler.



JARVIS' PATENT GAS CONSUMING FURNACE FOR SETTING STEAM BOILERS.

For plans and estimates for setting new boilers or re-setting boilers in use, those interested may apply to E. L. Rohbins, 210 Spear street, in this city (who is general agent for the Pacific States and Territories and ths Sandwich Islands). Mr. Rohbins will exhibit full descriptious and drawings of the Jarvis patent arrangements as applied to the common tubular boiler, the Babcock & Wilcox water tube boiler, the Corliss patent boiler, and to soda ash reclaimers. The old atyle or common setting of boilers may he changed to Jarvis' aetting in a short time.

There are general agencies for this patent at 422 East Twenty-third street, New York, 18 Second street, Baltimore, Md., 709 Market street, St. Louis, Mo., and 114 King street, Montreal. The general agency is at No. 7 Oliver street, Boston, Mass. It is already in use here hy the Standard Packing Co., tbe Contra Costa Laundry Co., Pioneer Woolen Mill Co., Philadelphia Brewery, Pacific Rolling Mills, San Francisco Tannery, etc. Some 1,400 of these furnaces are in use in the Eastern States, over 300 having heen put np this year.

Before the Camera.—We can't help entertaining a severe respect for that science which can instantaneonsly photograph a flying horse, hut forces a man to sit for four eternal minutes in front of a camera, his head braced into a pitch-fork, and his nerveless eyes staring relentlessly out into the fathomless realms of the undefinable.—*Rockland Courier.*

Dos Cabezas District, Arizona.

Editors Press:—I will in this give you hut a brief description of the Silver Cave mine and a few notes on the district.

Ths Silver Cave mins is located on an immense ledge of quartz, called tbs mothsr ledge of the district. This ledgs is traceable for a distsnce of 30 miles, and at different places the croppings are from 20 ft. to 150 ft. high and from 10 ft. to 100 ft. wide. The Silvsr Cave is the first claim located on the main ledge in this district and runs east and west. At the east or Cavs end the croppings are 100 ft. in widtb and fully 70 ft high; on ths north side is one pay streak, 16 ft. wide, that assays in gold from $5 to $20, and in silver from $18 to $40. It maintains its width and wealth for 400 ft. and shows at different places, hut smallsr and poorer, the sntire length of ths claim. In ths csnter of the claim a cross-cut tunnel has hssn run 70 ft., and has cut two pay streaks, No. 1, in the center of the cropping, is three ft. wide and assays in gold, on an avsrage, $45, and from $10 to $20 in silver. The owners, S. R. DeLong and J. S. Johnson, have worked hy ths arastra process, some 25 tons of ors from this pay streak averaging $32 in gold. In ths back end of the tunnel is streak No. 2, four feet in width, that will pay $8 per ton in gold.

On ths north sids of the main ledge is another lsdge of considerable sizs that carries some gold and dips to the south, as do all intsrvening strata of quartz and slate; and as the main ledge dips to the nortb, indications are favorahls for one ledge and fine bodies of ore at no great depth. This mine is destined to be one of the great mines of Arizona in the near future.

Mr. W. A. Neville, who has the Bear Cave honded, and is prospecting it, has not developed any honanza. Work is carried on very quietly, or secretly. Outsiders seem to know nothing of the doings at the Bear Cave.

On the 12th of November, Mr. Neville took honds on one-half of Juniper mine, and one-half of Ewell Spring mine, but the amounts of honda I have not heen able to learn. Mr. J. D. Emersley is at present doing his assessmsnt work on his fine prospects. Many of his prospects with small outlay wonld make mines of much valne. The Cincinnati and Pittsburg Mill Co. are erecting a very complete 10-stamp silver mill for custom work. The mill is from the shops of Law & Bodley, Cincinnati. They expect to have it running hy Feb. 1st.

The arastra mill of J. S. Johnson is idle at present, owing to breaking of spur wheel. New castings were ordered at the Risdon Iron Works, hnt have not been heard from yet.

Here, as in many other places, town lots seem to hs of more importance than the mines. When Mr. Neville first came here, he had the townsite surveyed, and put harh-wire fences aronnd some town lots, hy which several horses have heen crippled, and one cnt so hadly that he only lived a few minutes, hut still the wire has not heen taken down, nor any precautions taken to prevent further harm to animals.

Dos Cabezas, Cochise Co., A.T., Dec. 4th. E.

A Colorado Springs paper declares that the bullion crop of Colorado for 1881 may reach $30,000,000. Others have made the same estimate. There is no possibility of the actual returns reaching that figure. There is nothing from the mines to warrant it. If we get $23,000,000 we shall he doing mighty well under the circumstances.

California in the past 31 years has produced 54,897 flasks more of quicksilver than the celebrated mines of Spain and Austria combined.

Lecture to Young Mechanics and Apprentices.

[Concluded.]

No known degree of heat alone will separate the gases composing steam to make them assume their original state. The electric current will separate them slowly from water; with a strong current of electricity the two gases will form rapidly at their respective electrodes and escape to the surface. If collected, the same gases can be reunited by the same agency to form steam. A well-known law in magnetism is that all bodies charged with the same kind of electricity repel each other, and those charged with opposite kinds attract. In the two gases composing steam or water, we have two electric bodies of different magnetism, and when combined to form water may again be separated by a stronger magnetism or their stronger magnetic attraction for other bodies. But when combined in the form of steam the magnetic attraction of the gases for each other are satisfied, and form a molecule of steam.

The atoms of steam, when acted on by heat, may be said to be magnetized by a like magnetism, and consequently repel each other. A permanent magnet, when subjected to heat, loses its attraction. Prof. Tyndall has made a calculation of the force of attraction between the gases composing steam. He computed the force of 1 lb. of hydrogen and 8 lbs. of oxygen to form aqueous vapor, or 9 lbs. of steam, to be greater than the clash of a weight of 1,000 tons falling from a hight of 20 ft. against the earth. And that, in order that the atoms of oxygen and hydrogen should rise by their mutual attraction to the velocity corresponding to this enormous mechanical effect, a certain distance must exist between the particles. It is by the rushing over this distance that the velocity is attained, and it is by the repellant force imparted to the atoms of steam by heat, that we obtain the expansive force of steam. The greater the heat, the wider the separation of the atoms. The wider the separation the greater the power, but steam at 212° F. would require an increase of 250°, or a total heat of 462° to make it occupy the space of the original gases composing it, and to double its own volume requires an increase of 500° or a total heat of 712°, that is to double the distance between the molecules. Thus the gain in expansion is small in proportion to the increased temperature, being one five hundredths of its own volume to each degree.

If steam is thus composed of magnetic substances, and is susceptible to a high state of magnetism or electrical force, the question may be asked what effect does it have on boilers, or does it effect boilers injuriously when in this high electrical condition?

In my opinion, it does; but there are so many kinds of electricity or galvanic action, and so little known of the laws governing them, it may be even deemed hazardous to advance an opinion upon the subject.

As to subtilty of steam, it having neither taste nor smell, and being invisible at all degrees of temperature, makes it a difficult problem to solve or to tell what changes its properties do undergo at various temperatures.

And if, according to Mr. Cagnard de la Tour, the solvent power of steam is so great at 700° as to attack any kind of glass, we may safely infer it is proportionately so at all higher or lower temperatures. It has been long known that water contains a

Small Amount of Atmospheric Air,

And that the presence of this air promotes ebullition; consequently, the extraction of this air must retard ebullition. M. Donny, of Ghent, discovered this property in water, and says that water freed of its atmospheric air can be raised from 60° to 70° above its boiling point without ebullition; but when it does boil, it is immediately flashed into steam.

Prof. Tyndall says "pure ice is free of air, if melted in vacuo and will act in the same manner; if heated to the boiling point it will evaporate into steam with explosive force, and gives as a supposed cause of boiler explosions the extraction of this air from the water by long continued ebullition.

When water has been distilled over a few times without exposure to the action of the atmosphere its cohesion is increased, and owing to this increase will indicate (at a temperature of 210°), a density equal to that of sea water, from which we may infer that pure distilled water requires about the same temperature for ebullition as ordinary sea water. But if allowed free access to, or a little air is forced with it into the boiler, it will boil at the usual degree of temperature. The insipid taste of distilled water is removed by a short exposure to the action of the atmosphere. Boiler explosions are not usually charged to any explosive property in steam, but from the water in the boiler taking the spheroidal form or state, until it acquires a degree of heat near to that of the boiler, and then suddenly losing its spheroidal form and coming in contact with the over heated plates is flashed into steam, when in the spheroidal form it is buoyed up from contact with the plates by the intensity of the heat radiated, but on nearing each other in temperature it comes in contact with the plates, and instantaneous generation of steam results in explosion or bursting of the boiler.

Steam, in itself, is not explosive.

The Elastic Force of Steam

Should not be confounded with explosion.

It will fill the minutest cavities of space, and press alike in all directions, in whatever vessel it may be contained, expanding in proportion or increasing in pressure as the space is enlarged or diminished.

When superheated, it has the property of accelerating or increasing combustion. And many fires have been made to burn more fiercely when the supply of water is too small to overcome the intensity of produced heat; the steam generated only increasing the draft on the fire.

Attempts have been made to use steam as a fuel, but with doubtful success. The many uses to which it is

Applied in the Arts and Manufactures,

Mechanically and chemically, and its properties in each, are too varied to be enumerated here, when volumes might be written and not half told. Our Government has ordered, from time to time, experiments made with regard to boiler explosions; and hoards of engineers have been at work bursting boilers to find out the explosive nature of steam. Their aim seems to be more in the direction of testing the strength of the material used in boilers and the strongest form of construction, than in discovering any explosive property in steam.

If a board of eminent chemists and scientists were appointed to more thoroughly investigate the impurities in water, the gases that may be produced from the said impurities, their effect, when mingled or chemically combined with steam, its chemical or other action on the metals at different temperatures, the electrical currents produced by contact of the different metals used in the construction and fittings of steam boilers, there might be discovered the cause of many, if not all of the mysterious boiler explosions, for the electrical and chemical combinations that enter into effect in the construction of steam machinery are not half known.

If common salt increases the cohesion of water sufficiently to raise the boiling point 3° at the density of sea water and 10° at the point of saturation or precipitation, might there not be produced from mineral or chemical compounds held in solution in water a substance which, at a certain temperature, would unlock every atom of water contained in a boiler or when mixed with steam make it explosive?

The Electrical Currents

Produced by the combination of metals used in the construction of machinery, in connection with the boiler, may have some influence in separating the gases composing steam and thus rendering it explosive. The rushing of water of its air is said to make it flash into steam and may cause some of those explosions we read of. But the problem remains unsolved how that can be done in the working of the ordinary steam boiler, for nearly all pumps in use force more or less air into the boiler with the feed water, and in many instances a surplus.

Efforts have at various times been made to find a substitute for steam, but all have failed, the caloric engine coming the nearest to success.

The electric engine may supersede the steam engine in some instances, but in the production of that motor, either steam or water power is used, or a consumption of metals that will render it too expensive for general use until further discoveries are made.

The subject of steam might be extended to an indefinite length, but to sum up this article in brief, steam may be said to be a good absorbent of heat, a bad conductor, an excellent radiator, very elastic, a most useful vapor; and to it we are indebted in a great measure for the wonderful progress of the arts and sciences in the last century.

Useful Information.

A Novel Style of Steamship.—A project which is likely to assume great proportions at an early date came to light in Wall street recently. It contemplates a sweeping revolution in ocean steamship building, and it has the support of leading influential capitalists, principally Massachusetts men. Vessels are to be constructed without masts, and there will be literally nothing whatever above deck except the top of the pilot house and funnels. One of the projectors being interviewed, said: We have stepped forward to solve the problem by having our vessels covered, as with a shell, from stem to stern. This will place us above all danger of rough seas. Sweeping over us with whatever force they may, they can do no damage. No spars are torn out; no freight goes overboard; no lives are lost; everything is safe beneath the roof. The cost of the larger vessels will range from $550,000 to $650,000—at least one-third less than ordinary vessels of the same size. They are all to be built in this country. One of the objects of the enterprise is to bring back to the United States our lost commercial supremacy.

Gilding Steel.—Polished steel may be beautifully gilded by means of the ethereal solution of gold. Dissolve pure gold in aqua regia, evaporate gently to dryness so as to drive off the superfluous acid, re-dissolve in water, and add three times its bulk of sulphuric ether. Allow to stand for twenty-four hours in a stopped bottle, and the ethereal solution of gold will float at top. Polished steel dipped in this ie at once beautifully gilded, and by tracing patterns on the surface of the metal with any kind of varnish, beautiful devices in plain metal and gilt will be produced. For other metals the electric process is best.

Squeaky Shoes and the Remedy.

Preventives are always better than remedies. If you would avoid having squeaky shoes, direct your shoemaker to put some powdered soapstone between the inner and outer soles when putting them together. The "squeak" is usually caused by the friction of one sole upon the other in the act of walking. Sometimes, however, it is caused by air getting in between the inner and outer sole, in which case the pressure and bending of the leather in walking forces the air out and produces a squeaking noise. If the soles of a shoe are composed of a single thickness of leather, or two or more pieces properly glued together, they will not squeak. A piece of muslin gummed to the sides of the inner and outer sole where they come together, will also prevent squeaking. In shoes already made, and in a faulty manner, so as to squeak, make two holes, about one inch and half apart, through the outer sole, so as to insert the point of an oil can between the soles. A small quantity of sweet oil thus injected will generally cure the "squeak." If you do not succeed the first time, try again. A squeaky shoe always succumbs to the second dose of sweet oil. Three or four pegs or brads driven through the outer into the inner sole will oftentimes cure the trouble by binding them more closely together. But as trouble may arise from the pegs working through and injuring the feet, the remedies previously mentioned are preferable.

Glycerine.—It is from the candle-factories that the enormous supply of glycerine comes, which is now a very important article of trade. A few years ago it was wasted; now it is sent to the manufacturing chemist, who purifies it by distillation and filtration through bone charcoal, and puts it upon the market. It is put to a great variety of uses, many of which depend upon its peculiar properties of nonvolatility and absorption by atmospheric moisture. Harness makers and leather workers use it in making leather pliable; it is put into gas meters because it does not freeze except at a very low temperature; modelers keep their clay studies moist with it; tobacconists sweeten chewing tobacco with it, and ladies apply it to their hands and faces to soften the skin. Much of it goes into the manufacture of the terrible explosive, nitro glycerine, which is made by treating it with a mixture of sulphuric and nitric acid, or concentrated nitric acid. Not less than 3,200,000 pounds of glycerine are produced by the candle factories and utilized every year in this country, and yet so late as the year 1854 it was counted as worthless and run off into the sewers.

Hints to Users of the Telephone.—Most people, when they take up the telephone handle to listen to what the person speaking to them is saying, cram it so tight to their ear that no particle of the sound can escape. They seem to think that if they let any of the sound escape it will all go. This is a mistake, and the reason why those not familiar with its use have such difficulty in hearing what the person at the other end is saying. Too tight a pressure against the ear causes a hurring and confusing noise. Hold the receiver close to the under part of the ear, leaving an opening at the top, and the words will be heard much more distinctly. Another hint: Don't yell into the telephone as though you had decided on hurting your windpipe. Speak clearly in your natural tone of voice, keeping the lips about an inch from the telephone mouth. If you do this, you will save yourself and your correspondent a great waste of time and trouble.

How to make a Spontaneous Explosive.—The simplest method of preparing a mixture that will explode spontaneously, and that is unattended with danger if ordinary care is used, is to make a saturated solution of phosphorus in bisulphide of carbon, then to pour a small quantity of this solution upon some finely powdered chlorate of potass, resting upon paper. When this mixture is exposed to the air, the bisulphide of carbon rapidly evaporates and leaves the phosphorus behind, and in a condition of intimate mixture with the chlorate, far more perfect than could be obtained by mechanical means. On the evaporation of the solvent, as above described, the mixture presently explodes spontaneously with a loud detonation. The only precaution to be taken in performing this experiment, is to avoid taking too large a quantity of the material.

Cotton Duck for Roofing.—The use of cotton duck for roofing purposes is exciting a good deal of interest just now among agents of cotton mills now being built. The Lawrence Duck Co. have one-half of one of their mills roofed with duck, and though it was put on over a year ago, it now appears as good as new. The Pacific mills have also tested it with the most satisfactory results. These two roofs have been tested recently by experts, who found the material to have retained its bright appearance without any deterioration or apparent injury to the fiber. The Globe Yarn mills of Fall River have also adopted it for their new mill, and it is also in use by some few other companies.—*Boston Transcript.*

New Coloring Matter.—A Vienna chemist has succeeded in producing a new coloring matter on silk, which is a nice blue by day and a beautiful pink by artificial light. The alcoholic solution of this color is dark violet in a refracted, but red in direct light.

Good Health.

"Cancer Doctors."

Our advice, in the Press of Nov. 26th, to apply to a well educated physician in all cases of suspected cancers, rather than to any self-advertised "cancer doctor," has called forth the criticism of a certain party, who seems especially hurt at the term "quack." In common with others of a similar class, the communication referred to appeals to the progressive spirit of the age, the persecutions of Harvey, Jenner, and others, old fogyism, etc., *ad nauseum.* We have no disposition to enter into a controversy upon such a subject, but record our conviction that the regularly educated physicians of the present day are as fully abreast of scientific progress as any self-constituted cancer doctor can be. There has been no reasonable proposition for the cure of cancers nor any other disease, that has not been submitted by the faculty to the test of careful experiment, and there exists in London, we are informed, a cancer hospital, with a ward appropriated to the trial of new remedies for the disease. If our critic, or any other person, has a certain cure, there is an ample opportunity for trial, with a certainty of a large fortune, and the honor of the medical profession throughout the world and the gratitude of mankind as a reward. Such being the facilities afforded by the profession, it is folly for aspirants to talk of persecution, or for patients to expect relief at the hands of irregular practitioners. For our own part, we prefer to trust to the evidence of a scientific education in medicine than to the pretension of ignorant self-assertion.

How Printing Affects the Health.—Years ago there was a notion prevalent among those who were but partially informed upon the question that the printing business was especially detrimental to health. There was a tradition about the absorption of poison from the constituents of which type metal was composed. This was and is true so far as it asserts the poisonous nature of some of the constituent parts of type metal; but that these poisons should necessarily be absorbed into the system of the one who handles type is simply absurd. Printers who have such habits of cleanliness and sobriety as a decent respect for one's self and the opinion of others might be expected to dictate may follow their calling for years without experiencing any further damaging effects upon their health than what will result from close application to any sort of hard work. More "poison" is absorbed by the printer when taking observations of his little finger through the bottom of a glass than in any other way.—*The Chicago Specimen.*

Beware of Cough Medicines.—The Contra Costa *Gazette* says that at an inquest in Oakland, to ascertain the cause of death of an infant that had apparently been poisoned, it transpired that the mother had given it two doses of "Pulmonary Cough Medicine," to alleviate the croup. Dr. Buck, who made the autopsy, testified that the medicine contained laudanum in the proportion of 360 drops to 3 ozs. of the mixture, and that death of the child was caused by the excessive amount of laudanum in the medicine administered. The jury found accordingly, but cleared the mother of any intentional wrong, she being ignorant of the dangerous character of the mixture. It would appear that the law should provide safeguards that will prevent the misuse of poisonous drugs by those ignorant of their properties and effects.

Castor Oil as an Unction.—The London *Medical Journal* gives reports from various practitioners who have found purgative results to follow the inunction of castor oil. One writer states that he has frequently applied this oil to the abdomen, under spongiopiline, or other waterproof material, in cases where the usual way of administering by the mouth seemed undesirable, and with the most satisfactory consequences. In a case of typhoid fever, also, half an ounce of castor oil was applied in this manner, under a hot water fomentation, the effect of this being, as represented, to relieve the constipation and tympanitic distention that had been present, without undue purging or irritation of the bowels.

The Feet in Marching.—In order to make marching easier for the German soldiers their feet are wrapped in linen soaked with lard. But, on the march, especially where the roots are too big, the sticky mud will pull the boots off. During a parade before the Emperor, not long since, the boots came off by the hundreds, and a large fatigue party had to be sent out to pick up the foot gear.

The Third Set of Teeth.—Professor Owen, in an article lately published, questions whether man ever receives a third set of teeth. He ascribes alleged cases to the re-appearance of old and worn stumps, in consequence of the shrinkage and absorption of the jaws.

For Earache.—It is stated that asafœtida dissolved in water is a good palliative for the earache. Warm a few drops and drop in the ear, then apply wool to keep out the cold.

SAN FRANCISCO:
Saturday Morning, Dec. 17, 1881

TABLE OF CONTENTS.

GENERAL EDITORIALS.—A New Grinding and Amalgamating Pan; Double Engine and Double Drum Geared Hoist; The Mining and Scientific Press; The Hamilton Process, 393. Passing Events, 400. The Big Bend Tunnel, 400 and 417. Yuma; Sulphuret Ores; Bullion Product of New Mexico; The Bisbee Copper Mines, 401. The Sweepstake Iron Wagon; The Railroad Bridge at Yuma; Metallurgical Centers, 409. Notices of Recent Patents; The Mode of Working the Morey Ores, 420.

ILLUSTRATIONS.—Double Engine and Drum Geared Hoist for Double Compartment Shafts, 393. Jarvis' Patent Gas Consuming Furnace for Setting Steam Boilers, 398. Map and Cross Sections of Big Bend Tunnel, 400. View of Yuma, Yuma County, Arizona, where the Southern Pacific Railroad Enters the Territory, 401. The Southern Pacific Railroad Bridge at Yuma; Iron Sweepstake Wagon with Rack Bed, 409. DuBois' Automatic Quicksilver Feeder, 420.

CORRESPONDENCE.—From San Francisco to Tombstone; Nuggets; Rice Growing, 394. Tombstone District, 404. A Debris Compromise, 412.

MECHANICAL PROGRESS.—More About Water as Fuel; An Improved Loom; An Entirely New Water Wheel Governor, 395.

SCIENTIFIC PROGRESS.—Astronomical Progress; Conduct of Palladium, Rhodium and Platinum in a Gas Flame; The Aztecs; Electric Conductivity of Moist Air; Formation of Ice; Fine Ruling; The Atomic Weight of Platinum; The Youngest Scientist, 395.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meeting and Dividends, 396.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon and Utah, 396-7

USEFUL INFORMATION.—A Novel Style of Steamship; Gilding Steel; Squeaky Shoes and the Remedy; Glycerine; Hints to Users of the Telephone; How to make a Spontaneous Explosive; Cotton Duck for Roofing, 399.

GOOD HEALTH.—Cancer Doctors; How Printing Affects the Health; Beware of Cough Medicines. Castor Oil as an Unction, 399.

Passing Events.

The MINING AND SCIENTIFIC PRESS this week consists of 32 pages, replete with matter of interest and importance. It is devoted mainly to the interests of Arizona and New Mexico, but the usual departments will be found and much additional general matter.

From what we have said on another page it will be seen that our representatives in Congress are hesitating themselves in calling the attention of the Government to the debris question in California; and that they propose stone dams as remedies, said dams to be paid for by the general government. Our correspondent in another column has something to say on this subject.

The Gold Run mining case, involving the debris question, still continues at Sacramento. Testimony is now being taken on the miners' side, the most important witness being Hamilton Smith, Jr., Pres't of the Miners' Association, and one of the most prominent hydraulic mining engineers on the coast. The testimony is mainly as to the value and yield of the mines.

The Big Bend Tunnel.

A Great Enterprise for Working an Auriferous River Bed.

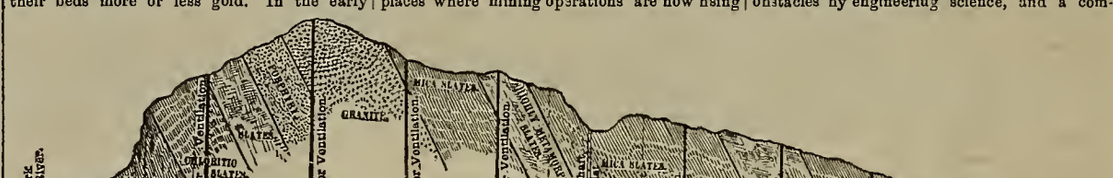
California is happy in being one of the few places in the world where auriferous earth exists, in the form of placers, gravel beds, drifts or bars. In consequence, all the rivers in the regions where these deposits occur contain in their beds more or less gold. In the early days of California fabulous amounts were taken from the river bars; and from the beds of rivers where the water was turned aside by wing dams. Of course, many localities were left unworked, owing to the heavy bodies of water passing over them; and others again were passed by because no adequate means of working them were thought of by the careless miners of those days. All old miners knew of these places, and many are the plans that have been drawn up for getting at them, the only drawback being, what is so commonly the case, lack of money to do the necessary work. In a number instances attempts were made to get at the rich bottoms by crude means and temporary structures, but it takes organized capital to attempt any such work on a large scale.

It has been known for many years, and the fact is substantiated beyond doubt, that Butte county contains some of the richest auriferous deposits in the world. Feather river and its tributaries have added many millions to the world's volume of gold coin, and wherever the beds of the streams have been mined, or in places where mining operations are now being carried on, the returns have been, and are very generous. A notable instance was that of the "Cape Claim," situated about one and a half miles above Oroville, on the Feather river, in Butte county. In the year 1857, a party of miners organized a company with a capital stock of 200 shares, of $600 each; at a cost of $120,000, they built two dams across the river, 3,400 ft. apart, with a flume of sufficient capacity to carry the whole body of water in the river past both dams, and discharging into the river below the lower dam, the water between the two dams being pumped out by means of the power afforded by the main flume. When the water of the river bed between these dams was exhausted, men were set to work shoveling the gravel into "long toms," and sluicing in the most primitive manner, yet, the returns were simply enormous; then, an unseasonable and unexpected rise in the river carried away the entire works in a single night, and the books of the famous "Cape Claim" were closed.

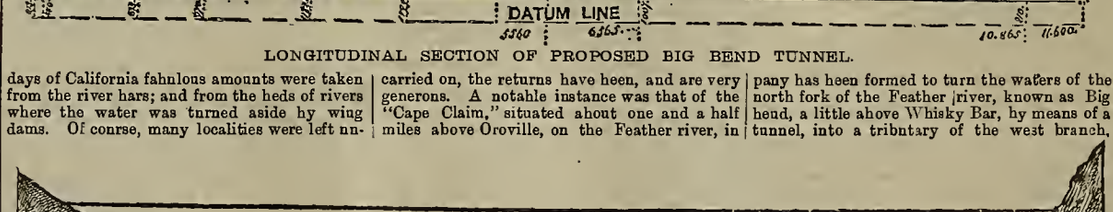
It is now proposed to get at these riches in a systematic way, and to overcome the existing obstacles by engineering science, and a company has been formed to turn the waters of the north fork of the Feather river, known as Big bend, a little above Whisky Bar, by means of a tunnel, into a tributary of the west branch, called Dark canyon, which empties into it a few hundred feet above the confluence of the west branch and north fork of Feather river, about 10 miles above Oroville, Butte county. A great many people have thought something of this kind could be done, but it was only within a year that the project began to assume shape, and was seriously investigated by Col. J. C. Lo-

(CONTINUED ON PAGE 417.)

MAP SHOWING BIG BEND, NORTH FORK OF FEATHER RIVER, AND LOCATION OF TUNNEL.



LONGITUDINAL SECTION OF PROPOSED BIG BEND TUNNEL.



CROSS SECTION OF NORTH FORK OF THE FEATHER RIVER AT BIG BEND TUNNEL.

Yuma.

We give on thia page an engraving of Yuma, the county aeat of Ynma county, Arizona, which ia aituated near the jnnction nf the Gila with the Rin Colorado, and ahout 20 niles north of the Sonora line. On a commanding bluff, opposite the town, on the California eide of the river, is Fort Yuma, built on the aite of a miasion eetahlished here hy the Spanish fathera as early as 1771, and deatroyed hy the Yuma Indiana 10 yeare later. The firet eettlement at the aite of the town of Yuma was made hy Dr. Lincoln and others in 1849, who eetahliahed a ferry over the Coloradn to accommodate the thousande who flocked to the newly diecovered gold region of California. An outhreak among the Indians dcetroyed the ferry and killed all the owners except three persons. In 1850 the ferry waa again started hy Don Diogo Jaeger and othere. The party wae again attacked in 1851 hy the Indians, who compelled them to abaudon their enterpriee and retreat tn California. In 1852, Heintzelman and Stoneman (both of whom afterwarda roae to high commanda in the civil war), marched across the Colorado deeert with a detachment of United States troops, and eatahliehed the post of Fort Ynma. The ferry wae again started, and the village of Arizona City grew up around it. In 1864, Yuma wae made thedietrihuting point for the military poste in Arizona, and advanced rapidly in population and huaineaa. It containe several large etores, three hotels, (one owned hy the railroad company), a large wagon ehop, blackemith ahope, saloone, etc. It has one pnhlic echool, with a daily attendance of 50. The Sieters of Charity have aleo a flonrishing echool at this place. The Territorial prieon ie eitnated here. It is a eccnre and roomy etructure, huilt of stone, and aitnated on a hluff above the Colorado. The railroad company have huilt exteneive ehops at thie point and give employment to a large nnmher of men; they have also erected a fine hridge over the Colorado. The popnlation ie about 1,200. Yuma'e eituation at the junction of the two largeat etreams in the Territory, the rich mining counitry which lies to the north and eaat of it, and its nnrivaled climate for those trouhled with lung dieeaaes, will alwaye insure ite permanency and proeperity.

Theee faces, which we take from the pamphlet on Arizona issued hy authority of the Legielatnre, are eupplemented hy the remarks of onr epecial correspondent which we give in another column of thie ieeue.

Sulphuret Ores.

In many inetancee, the emall aize of quartz veins, the hardneaa of the country, distanee from centere, preeence of water, etc, render quartz mining unremunerative; hut in a great nnmher of instancee, the ahandonment or neglect of onr quartz veine ie dne to want of experience and want of proper appliances, rather than to the poorneee of the qnartz. Again, the comhination or aeeociation of other metale with the gold, tende to leseen the value, and in the ahsence of the meane of separating and saving the whole of theee metale, and the ekill to employ euch meaus to the greateet advantage, eome veine are regarded ae unremunerative, which, under ekillful management, would prove highly remunerative.

Taking into conaideration the large number of quartz veine on thie coast up to the present time, comparatively little attention hae heen paid to the eaving and treatment of pyritee. In many instancee, quartz heavily charged with pyritee, is crushed at a hattery where there are no appliancee for eaving them, and where, in fact, no attempt is made to save them. Theee pyrites are frequently carried off with the tailinge into a creek and loet. The loss eustained hy the waste of euch material, though there are no meane of eetimating ite extent, must he very great, and what is woree, the loss may he eaid to he irreparahle, hecanee it would he impossihle to collect the material again. If the gold thus lost could have heen eaved, many claime ahandoned as nnremnnerative might have heen worked with profit for yeare to come.

We have ahundant proof that minee that pay under some circumstancee, will not pay under others. We know that many minee ahandoned 20 years ago in California, are heing made to pay now through hetter conditione, greater care, more metallurgical skill and improved appliancee. It ie to he hoped that many yeare will ont elapse hefore eome perfect, simple, and ahove all, cheap means will he found to work onr snlphureted ores, in which caee, hundrede of mines now idle will he started up, and many never opened will he developed.

THE county eeat of Alturas county, Idaho, hae heen settled in favor of the town of Hailey hy a decision in the District Court, juet rendered hy Judge Prickett, who decidee that Hailey, not Bellevue, is entitled to the county eeat. This will give a hig etart to the town of Hailey.

THE output of hullion from Georgetown ie largely increaeing, and in a ehort time new reduction worke will he required.

[Published by permission of E. Conklin, Author of "Picturesque Arizona," etc.]

VIEW OF YUMA, YUMA COUNTY, ARIZONA, WHERE THE SOUTHERN PACIFIC RAILROAD ENTERS THE TERRITORY.

Bullion Product of New Mexico.

Very little has heen done in the way of developing the eection'e mineralogical reeources, as may he eeen from the following tahlo, whioh affords a close estimate of the yield since New Mexico heoame a portion of the territory of the United Statee:

1848 to 1868	$2,500,000
1868	250,000
1869	500,000
1870	500,000
1871	500,000
1872	500,000
1873	500,000
1874	300,000
1875	325,000
1875 to 1880	2,200,000
Total 1848 to 1880	$8,075,000

But it ie etill helieved that the developmente will prove that the Territory ahounde in earthly treaeuree. Saye the *Sentinel*, epeaking on thie point: "The minee and placere and coal fielde of the Territory eeem, from the discoveriee made and from the indications, to exiet, acattered all over the country. Gold, eilver, iron, quicksilver, marhle, coal, hnilding etone and precioue etonee—indeed, nearly all metale and other productione of the grnund which contrihute to the nse and pleasnre and wealth of men—appear to exiet in New Mexico. The valnahle oree ahonnd almoet everywhere in the granite and gneies of the Rocky mountains, and the economic queetion ie not to find the material, hut the capital and lahor with which to work. That the conntry over which theee inveetigations were made ie replete with thoee minerale, which, hy their decompoeition, are fonnd hy experience to moet enrich the eoil, ae it ie with the heforo mentioned minerale of commercial value.

"Gold ie known to exiet in over 50 different localitiee in the Territory. It and eilver must have heen known and exteneively mined hy the Aztecs, ae the preeence of their old ruine is said to hean almoet unfailing indication of minee. The Spaniarde mined gold, eilver and copper in thie region, and Jeeuit prieste more thoroughly proepected it than it hae heen since. They reported at all pointe great richee and the exietence of all the precioue metals. At the Placer monntain, the Old and New Placer quartz lodee have heen opened eince the war.

"At the Moreno minee, at Ute creek, and other trihntariee of the Cimarron and Red river, large depoeits of gold have heen diecovered and worked.

"At Pinos Altoe, quartz gold mining hae received considerahle attention. Thirty lodes were discovered, paying from $40 to $200 per ton. In thie dietrict a few years ago 30 lodee of gold quartz were worked, 10 of eilver or a comhination of eilver and gold, and three of copper. There have heen picked up in one day in a gulch at Pinoe Altoe orea of gold, eilver, lead, zinc, magnetic iron and plumhago. The nnmher of minee now worked there hae largely increaeed.

"Twenty-eeven milee from the city of Santa Fe is the Real de Doloree or Old Placer, diecovered in the year 1833, and from then up to 1840 it contained a popnlation varying from 2,000 to 3,000 pereone, the most of whom were engaged in waehing out gold, lahoring under great dieadvantage on account of the ecarcity of water, it heing neceeary to carry the dirt to the water, a dietance of nearly two milee, or pack water in kege and harrele to the dirt; there were at one time some dozen or more etoree there with merchandiee. The amonnt of gold taken out hy this rude proceee is varionely eetimated from $300,000 to $500,000 yearly. Many rich goldhearing quartz lodee were diecovered, hut owing to the want of water and proper machinery were not worked to any extent."

I have eetimated the production for the calendar year 1880 to have heen: Gold, $130,000 eilver, $425,000; total, $555,000.

The Bisbee Copper Mines.

The town of Biehee ie eituated 50 milee, hy etage, and ahout 25 hy trail over the mountaina eouth of Tombetone. Here are located eome of the richeet copper minee yet fonnd in the Territory. The Copper Queen ie an extraordinary mine, and the most exteneive. Ite exploratione extend for many hundred feet, and ite output ie immenee. Two 30-ton emeltere are kept running constantly; the daily output ie from 12 to 15 tone.

The ore ie the red and hlack oxide of copper. Some magnificent epecimene of crystalized green carhonate of the ore heing fonnd, we hrought away one epecimen whioh hse not heen excelled. Ore is ahundant everywhere, in fact, the mountain seems to he composed of it. The mines are 20 miles from the Sonora line, and 75 from Beneon, on the Southern Pacific railroad.

The mine is owned mostly in New York where the headquartere are. Thie mine hae produced eomewhere in the neighhorhood of a million dollars. The Neptune company own several claims at thie place and have a emelter erected eome nine or ten milee from Bisbee on the San Pedro, which at this point ie a small stream. The Twilight, Bounty, Galena, Cave, Garfield, Golden Gate, Copper King and othere are located at thie point, and all have more or less ore. The per cent of copper is from 5 to 25.

ORE and hullion etill continue to arrive in Salt Lake from Wood River.

On the Milling of Gold Quartz.

[Written for State Mining Bureau by MELVILLE ATTWOOD.]

H. G. Hanks, Esq., State Mineralogist.—Dear Sir: My last paper to the State Geological Society on the "Milling of Gold Quartz," wherein I tried to describe the process of simple amalgamation of the raw pyritic matter in wooden barrels, appears from the great number of letters that I have received respecting it, after its publication in the MINING AND SCIENTIFIC PRESS, to have attracted considerable attention, and has, therefore, encouraged me to resume the subject, but this time as a contribution to the Mining Bureau; you having kindly offered to allow the specimen accompanying this paper, and intended to illustrate what I have stated, to remain for a short time at the rooms of the Bureau, to give those who feel interested in the matter a chance of examining them. You have also promised to put some very important and interesting specimens from your private collection with them.

I can only now repeat what I have stated on a former occasion that at the present time I think scarcely anything can be of greater importance to the mining interests of this State, than a simple and cheap mode of extracting the gold from low grade vein-stone, and the determination of the true condition of the ores associated with it.

The "Free Gold,"

As it is called, can easily be saved, indeed, in the language of the old millman, "only give it a chance and it will take care of itself" is very true, particularly so when met with, as it is in some of the Bodie veins, carrying scarcely any pyritic matter. The difficulty in the

Concentration of the Sulphurets.

(I use the Californian term, which, as I stated before, was, I think, first applied in Nevada county, in 1859, to the pyritic matter associated with the quartz in the gold bearing veins of this State), appears now to be, in a great measure, overcome by the use of the "Frue concentrator," which, with comparatively little attention, and at one operation, makes very clean work. I have served a very long apprenticeship in the "dressing" of different kinds of ores, but in all my experience never remember any machine which pleased me better than the "Frue." The rubber surface of the revolving cloth appears to greatly assist the operation.

The question of concentration being now so far solved, it renders it desirable, indeed necessary, for isolated mills to have some cheap and easy mode, which they can use at their own works, to extract the gold from the concentrations.

The following is a copy of a paper on "Iron Pyrites" read before the Royal Society of New South Wales, in 1874, by J. Latta, Esq., which contains much valuable information:

"*Mr. President and Gentlemen:*—At the request of some of the members of the Royal Society, I have ventured to occupy part of your time this evening in describing the method of

Treating Pyrites for the Extraction of its Gold,

As carried out by the Port Phillips company, at Clunes.

"In 1861, I was engaged by that company as their chemist and assayer, with special instructions to devise, if possible, a process for profitably extracting the gold from their pyrites, which was then but little better than a waste product. Except processes inapplicable to our circumstances, such as smelting, etc., the only known means for extracting gold from such mineral was that practiced in South America and the United States,—'of exposing the auriferous sulphides to the action of air and moisture for a year or so, whereby a portion of the mineral became oxodized, liberating the gold previously enclosed by the sulphides, the mineral was then passed through the stamping battery with quartz, and whatever portion of the sulphides remained undecomposed was retained, as well as the then rude machinery for that purpose admitted, to undergo another term of oxidation, and so on whilst any remained.' I scarcely need to point out how extravagantly wasteful of time and gold such a process must have been. Yet even at the present time this process is occasionally practiced in Victoria. At some claims the blanketings—that is the pyritous sand, with a little free gold caught upon the blankets—are, after a time, again put through the batteries with the quartz, for the purpose of extracting its gold. Any one practically acquainted with the treatment of mineral containing fine gold by the battery process, will at once recognize the impossibility of retaining a fair proportion of such minutely divided gold as oxidized pyrites affords; by far the larger portion would be held in suspension by the water, and be carried away by it through all the appliances devised for its retention. In addition to the difficulty of retention arising from the fine state of division which gold so obtained possesses, most of these particles would be

Coated With Iron Oxide,

And other products of the decomposed mineral, thus offering another hindrance to its chance of amalgamating with the mercury. This latter difficulty deserves careful consideration, where fine gold has to be dealt with, as from its fineness it escapes the scrubbing which the larger grains receive from contact with the quartz whilst crushing, whereby their surfaces are cleaned, and thus rendered extremely sensitive to the influence of mercury placed for their detention. In reference to the condition of the gold in pyrites, it has come to be pretty generally admitted that 'nearly, if not quite, all the gold exists in the metallic state.'"

This quite agrees with the results of some experiments carried out by myself in conjunction with Mr. Daintree, late of the Victoria geological staff. Our researches ended in obtaining but the barest possible evidence of

Gold Existing in a Mineralized State in Pyrites.

As a matter bearing somewhat in support of this result, and whilst engaged in these investigations, I had the good fortune to come across some fine specimens of cubical pyrites, which upon examination with a pocket lens, seemed to indicate the presence of gold; upon transferring them to a good microscope, gold was distinctly seen upon the planes of cleavage, and upon dissecting the crystals, every cleavage face was found distinctly gilded. Now, from the fact that the presence of gold could only be determined by the aid of a good microscope, and that only as a fine gilding, some notion may be formed of the excessively fine state of its division, and how unsatisfactory would he the task of separating such liberated films from water in motion.

Guided by these considerations it became evident that any attempt to mechanically separate gold from pyrite—unless aided by the previous decomposition of its enveloping sulphides—must prove ineffective from the impossibility of reducing it to its ultimate atoms, for so long as a cluster of sulphide atoms remain unbroken, they might reasonably be imagined to enclose those of gold. Again, it was equally clear that, when such gold was liberated from its envelope, water concentration alone was inapplicable. To test the correctness of these conclusions, each of them was made the subject of rigid experiment on an extended scale, before receiving them as fundamental truths to guide us in determining the best method suitable to our requirements. Two parcels of pyrites of twenty tons each—one roasted, the other unroasted—were ground in one of the best arastras known, with mercury; a constant stream of water flowing through to carry off the finely ground sand, which was then carried through mercury boxes and over blankets. Each parcel received the same amount of grinding and treatment in every detail. The results are as follows:

Twenty tons raw sand containing 3 oz. 6 dwts. per ton
Gold obtained.....29.21 p. c.
" in tailings.....42 84 "
" carried off in water.....27 95 "
Twenty tons roasted sand, 1 oz. 7 dwts. 10 grs. of gold per ton.
Gold obtained.....51.57 p. c.
" in tailings.....27 21 "
" carried off by water.....21 22 "

Here it will be observed that, with the raw sand, only a small portion of the gold was obtained—a very much larger was left in the tailings, although finely ground, and a large proportion was carried off with the water as slime. With the roasted mineral more than half the gold was obtained; the tailings were much poorer than those from the raw sand, but still very rich, and a large quantity was carried off by the water.

After carefully considering the merits of the various methods suggested for extracting gold from pyrites, our first problem to solve was how to best

Destroy the Enveloping Sulphides

And arsenides, so as to get rid of the deleterious action of these minerals upon the mercury used for amalgamating and detaining the liberated gold; and, secondly, the best method of extracting the gold from the decomposed pyrites. After a number of experiments on a large scale, it was decided to effect the decomposition of the pyrites by a roasting process. To effect this economically, I devised, and in conjunction with Mr. H. A. Thompson, patented, in 1862, the

Inclined Roasting Furnace,

Which is now used in many places throughout the Colonies. It consists of an inclined roasting hearth, usually about 30 ft. long by 5 ft. wide; the fire-hole for heating the hearth on the lower end of it, and is separated from it by the fire bridge; between the latter and the hearth is a channel for conveying into the store-pit the sand when roasted. In the foot wall of the furnace are 6 tubes, from 1½ to 2 inches diameter, for supplying heated air to the roasting sulphides; scarcely any air is admitted through the fire bars, the gaseous vapors from the fuel being completely burned by the great excess of air passing over the fire for oxidizing the pyrites. Along each side of the furnace are five working doors, for the workmen to turn and rake down the mineral. Above the upper end of the furnace a large hopper is constructed capable of holding 24 hours supply of sand; in the floor of this hopper is a trap for supplying mineral to the hearth; the hopper is filled by trucks communicating with the puddles by a tramway to the stamp-house. The whole of the furnace is carefully braced with vertical longitudinal and transverse ties. The present furnace has been working about ten years, and, with fair treatment, will last many years more. In working this furnace the whole of the hearth is covered with pyrites to the depth of between 2 and 3 inches, kept at a gentle red heat, with frequent stirring, until the mineral nearest the fire, and about 6 ft. beyond it, is found no longer to give off sulphur fumes. An experienced workman can determine when this condition has been attained by its appearance in the furnace. It is then raked into the discharge channel and the mineral lying upon the hearth immediately above that removed, is brought into its place; again, that still further up is brought a stage lower, until the whole has been shifted, when the vacant place at the upper part is refilled from the hopper. The sulphurous and arsenical vapors, together with the products of combustion and dust from the pyrites, pass into a tunnel between 200 and 300 ft. long, 4 ft. high, and 3 ft. wide, carried up the side of a hill, terminating in a chimney 30 ft. high. Nearly all the sand and dust carried over by the draft is deposited within 40 ft. of the furnace, and is periodically removed for re-treatment, as it contains a notable quantity of gold; beyond 40 ft. the sand is worthless. From the size of the tunnel the vapors move slowly onward, and have, consequently, time to deposit any heavy particles; continuing their course, the vapors pass through 6 cellular brick screens, down which a powerful spray of water passes; here they get cooled and scrubbed, the sulphurous and sulphuric acids dissolved out, whilst the arsenious acid is deposited on the floor of the tunnel, scarcely anything escaping from the chimney but the foul vapors. Some alarm was felt by the Town Council lest any

Arsenical Vapors

Should escape and prove injurious to the inhabitants, as the works were close upon the township, and they placed the matter in the hands of Mr. Johnson, the Government analytical chemist, for investigation, who reported as follows: "I drew five gallons of the vapors from the chimney of the roasting furnace, and by the application of one of the most delicate tests known to science, viz, Reinck's test, discovered but the merest trace of arsenic." I may remark that when this investigation took place we were condensing over two tons of arsenic per month in the tunnel. I have dwelt somewhat lengthily upon this part of my subject as I am desirous to show that, with due precautions, such operations can be safely carried on in the neighborhood of habitations.

In carrying out the roasting operations the work is divided into three shifts of eight hours each, one man being able to attend a furnace, and finally to cover up the hot sand discharged with damp sand and spray it with water. This quenching was found to be a matter of some importance, as the quartz sand—always found with the pyrites—is thereby broken up and rendered friable, by which the after process of grinding is greatly facilitated. The quantity of sand which a furnace of the above-mentioned size can treat, will average 4 tons per 24 hours with a consumption of 3-10 of a cord of wood per ton. Having determined upon a

Mechanical Process for Extracting the Gold

From the roasted mineral, it became necessary to discover the best condition for accomplishing it. In this, also, we were greatly assisted by the knowledge gained of the physical condition of the gold in pyrites. Consequently, after our earlier experiments already mentioned, we carefully avoided a current of water, and ground with mercury without an overflow until it was considered the gold had become amalgamated. By cautiously varying the experiments, and ascertaining the proportion of gold obtained in each case, we were led up to the present method of working. From the results of a great number of experiments, it was shown that the quantity of water used in the grinding process was a matter of considerable importance, the success of the operation to a great extent depending upon the sand being in a damp condition only; by this means the mercury becomes thoroughly diffused, and every grain of sand has a particle of mercury in contact with it, consequently there is afforded abundant opportunity for the gold to amalgamate. On the other hand, if sufficient water has been used to convert the mass into a semi-fluid state, the mercury remained at the bottom of the mill, the surface only being in contact with the sand, consequently the opportunity for amalgamation was considerably lessened, and the quantity of gold extracted very much less than when working damp sand only. As the result of these experiments, the following process has been adopted: The sand, after being roasted, is ground—only moderately damp—with an equal weight of mercury for three-quarters of an hour, under the rollers of an ordinary Chilean mill; water is then allowed to flow into the basin, the mill still revolving, until nearly all the finely ground sand has been carried off in the overflow to the concentrator; the mill is then stopped, the water drained off from the unground sand and mercury, again started, and re-charged with fresh sand, and so on until it is necessary to clear out the amalgam—generally once a week, depending upon the richness of the mineral treated. The finely ground sand passed into the concentrator is kept slowly stirred for a quarter of an hour, to keep the sand in suspension in the water, and allow the mercury and any amalgam which might have been carried over from the mill to gravitate through it; the water with its sand is then slowly run through a smaller concentrator, to retain any valuable particles which might have escaped the first, and is then considered sufficiently impoverished to be allowed to run away.

The quantity of roasted mineral the company treat by this process, when working, averages 18 tons per week—the duty of two mills worked in eight-hour shifts, one man attending them, alternately charging and discharging.

The Average Proportion of Gold Extracted

During the last year, from 294 tons of pyrites, amounted to 95.19 per cent. of the assays, the sand averaging 4½ oz. of gold per ton. Some of the parcels returned as high as 98 per cent. during that period. The cost of extraction amounted to £2 2s. 4d. per ton, without estimating wear and interest on capital. The above charge is rather high, as fuel during that period was unusually dear, and the furnace being but 4 ft. wide instead of 5 ft., increased the labor cost, as less work is done at the same cost than would be incurred in working a larger furnace. Another element in the cost is the mercury which is lost, amounting to 1 lb. 13 oz. per ton—a large proportion of which, I think, might be saved by improved appliances for that purpose, together with the gold contained in it. The immediate cause of this loss of mercury is the severe trituration to which it is subjected with the sand. This was found indispensable, for whenever, through oversight or experiment, a less degree of trituration was applied than that now used, or the sand ground too wet, the return of gold was invariably diminished by several per cent.

In carrying out these operations, I found that a large proportion of galena in the mineral seriously interfered with the extraction of the gold, but a small proportion of the sulphides of copper, zinc or lead, produced no appreciable effect.

Taking the process as it stands, we have been unable to find one that would at less cost extract the same proportion of gold, or could be safely trusted in unskilled hands with only occasional supervision.

Mr. Thompson also read the following return:

Returns of pyrites treated at the Port Phillip Co's. Works, Clunes, since Oct., 1866. Minerals treated: 1867, 215 tons, 17 cwt.; 1868, 366 tons 9 cwt.; 1869, 401 tons 11 cwt.; 1870, 431 tons 9 cwt.; 1871, 561 tons 2 cwt.; 1872, 368 tons 6 cwt.; 1873, 294 tons. Gold, contents per ton, per assay: 1867, 4 oz. 16 dwts. 6.93 grs.; 1868, 3 oz. 18 dwts. 6 56 grs.; 1869, 4 oz. 1 dwt. 19.15 grs.; 1870, 3 oz. 11 dwts. 4.34 grs.; 1871, 4 oz, 7 dwts. 10 99 grs.; 1872, 5 oz. 18 dwts. 19 36 grs.; 1873, 4 oz. 10 dwts. 16.30 grs.

Total gold obtained: 1867, 960 ozs. 13 dwts.; 1868, 1,322 ozs. 13 dwts.; 1869, 1,515 ozs. 11 dwts.; 1870, 1,370 ozs. 4 dwts.; 1871, 2,290 ozs. 1 dwts.; 1872, 2,031 ozs. 9 dwts; 1873, 1,268 ozs. 17 dwts. 12 grs.

Gold extracted, per ton: 1867, 4 oz 9 dwts.; 1868, 3 oz. 12 dwts. 4 grs.; 1869, 3 oz. 15 dwts. 11.60 grs.; 1870, 3 oz. 3 dwts. 12 60 grs; 1871, 4 oz. 1 dwt. 15.20 grs.; 1872, 5 oz. 11 dwts. 22.56 grs.; 1873, 4 oz. 6 dwts. 7.63 grs.

Percentage of gold extracted: 1867, 92 43; 1868, 91.71; 1869, 92.28; 1870, 89.24; 1871, 93.34; 1872, 94.22; 1873, 95.19.

The results obtained by Mr. Latta, appear to have been exceedingly close and satisfactory, though rather costly—about ten dollars per ton—which, I think, could have been much lessened had the stuff been reduced finer, and the concentration been carried a little further, so as to have freed the pyrites from the excess of gangue or quartz sand previous to calcination.

It is now generally admitted by metallurgists of any note, that the gold in pyrites exists in a metallic state, and it is with no little pleasure that I am enabled to

Practically Corroborate the Statements

Of Mr. Latta on this subject, having procured for your inspection a number of crystals and fragments of crystals, of auriferous pyrites, obtained from different parts of this State. They are mounted on glass slides for microscopic examination—as with a common lens the presence of the gold can hardly be detected, but with a good microscope, using an inch or half inch objective, it will be found that the faces of some of the crystals are, in places, most finely and beautifully gilded, and that, here and there, are seen little specks or drops of gold, partially imbedded in the pyrite.

The mill-man after looking at these specimens, will not be surprised at the loss sustained in the wet stamping of auriferous pyrites.

It will generally be found amongst those who most strenuously favor the idea of the existence of rebellious gold ores, are men who have a valuable mine to sell, results from which can only be obtained by vapor assays (see MINING AND SCIENTIFIC PRESS, Jan. 17th, 1880, and Oct. 9th, 1880.); or the man with a process, by which he professes to extract all the gold from rebellious ores, or even that which is said to exist in the Calistoga water (the best results from which are obtained when chloride of gold is added). In Phillip's Metallurgy, page 166 and 167, very good directions are given for

Sampling and Assaying Gold Quartz.

For assaying, he says: "The most accurate results are obtained by carefully washing a four-pound sample in the batea. After having in this way concentrated the gold in about an ounce of sand and pyrites, this residue may be either subjected to assay, or the sulphides dissolved by nitric acid, and the gold extracted by amalgamation with mercury, which is subsequently volatilized, and the gold weighed. In either case, calculations are made on the four-pound sample, and when the residue has been subjected to fusion, very accurate results are obtained."

During the time I was engaged in gold mining in Brazil, I stayed for some time at the St. John del Rey mine and there witnessed the

Barrel Amalgamation,

Which I described in my last paper to the State Geological Society.

By careful analysis their concentrations differ but little from those of some of the mines near Sonora, Tuolumne county, Cal.; the amount of arsenic varying from one to ten per cent., though in the upper part of the St. John del Rey mine, it did not contain so much arsenic as the following analysis, made by John A. Phillipe in 1847, shows.

Analyeis of uncrushed ores from the St. John del Rey mines, made by J. Arthur Phillips, in 1847:

Silica	16.87	
Carbonate magnesia	12.17	
Carbonate lime	3.01	
Sulphur	16.77	Iron Pyrites.
Iron	14.65	
Peroxide of iron	32.84	
Peroxide of manganese	3.63	
Arsenic and gold	Traces	
	99.94	

N. B. Gold per ton equal 1 oz. 2 dwt. 20 gr.

The reason I have said so much about those mines and called your attention so frequently to them, is from the fact of their successful treatment of such a difficult vein-stone for so many years. To properly understand the magnitude of the work, suppose we estimate the yield of the vein-stone in California, from all the mines in pyritic matter, to be, say 5 per cent. of all that is worked—which is rather high—it will hardly equal that treated daily at the St. John del Rey works.

The results of years of experience in working such a mine ought to be interesting even if it were not exceedingly valuable, as it really is; yet there are not wanting those who object to any information obtained from the reports of such as the St. John del Rey Co. on the—not very wise—grounds of the mine being worked in Brazil, and the reports printed and published in London and, may be worse than all, that the dividends are, and have been for the last forty years, paid there. In the

Milling of California Gold Quartz,

I would advise, for low grade rock, the stamping of it as coarse as such a machine as the "Frue," or other improved concentrator can treat to advantage. The size of the aperture in the screens should gradually increase, and be the largest in the upper part, which would, in a great measure, prevent what is termed "dead stamping," and, at the same time, add greatly to the duty of the stamps. Screens having 12 holes to the linear inch in the bottom and 10 in the upper part, are not too coarse for low grade rock. The fineness of the stamping, however, is in part regulated by the position of the screen, that is, their horizontal distance from the stamp-head and the vertical hight of the bottom of the screen above the level of the die. For example, the finest work is done by splash-stamping, that is, without using any screens, and allowing the pulp to be discharged over the front side of the mortar, which is purposely made lower than the back or feed part of the mortar.

The Port Phillip Co., in Australia, I believe, use them with 10 holes to the linear inch. Steel wire-cloth is the best and will, I am told, last better than any other.

Some years ago, in a communication to the State Geological Society on the subject, I recommended fine stamping for low grade rock containing a large proportion of sulphurets; but recent improvements in concentrators, and a closer examination of the condition of the gold in the iron pyrites, of which I find so large a proportion is in thin films, and which, with a rapid flow of water, would be carried away, and a greater part of it lost, have altered my opinion on this point.

It is not generally known, but nevertheless, from numerous and very careful tests, it is proved that in fine stamping, when the speed of the stamps is above seventy blows per minute, that the loss of gold, when blankets, or raw hides, are used, is much greater than at a speed of fifty blows per minute; though I am not aware that any tests have been made when the amalgamation was done in the battery. The system of

Amalgamation in the Batteries.

However, I have always considered a mistake and as entailing a great loss of gold, particularly so, when the rock contains a large proportion of sulphurets; besides, if precautions are not taken, a low degree of temperature will render the amalgamated silver plates nearly useless. To understand this correctly let the mill-man put two or three barrowfuls of rock, very rich in sulphurets through the stamps and then watch the effect on the amalgamated plate, and at the same time collect some of the pulp after passing over the plates, and have it carefully tested and he will then better understand why I prefer the blanket system.

Prof W. W. Smyth, in one of his lectures on gold, with respect to stamping, says: "Take a large hammer and gently crack a nut with it, and you have an illustration of what a stamp had ought to do; it ought, if possible, to crack the enveloping shell of stone, and set free the kernel of metallic mineral unbroken."

Or, for instance, take a piece of veinstone from the Bodie district—the same as marked No. 26—one-half of it pound very fine, using a grinding action with the pestle, then wash out the gold in a batea, or horn spoon, and you will find that a large proportion of the gold will float away, in spite of every care, even using ammonia to destroy the grease on the ends of the fingers.

Then take the other half, pound it very coarsely, and in washing out the gold you will see very little float, and two or three turns of the batea will bring all the gold into the center.

In the Blanket System,

Where improved concentrators are used, after the pulp has passed over the blankets, only two lengths of trays of about four ft. each, and two sets to each five stamps, are required. They should be so arranged that the inclination can be altered, say from 3° to 5°, to suit the stuff being treated.

The trays should be about 16 inches wide, and the fall from the battery box to the head tray the same as from one tray to another, about four inches, with a board placed across the end that the fall of the water or pulp will be so broken as to strike the blanket in the tray below, nearly at right angles. The blankets should be in three-ft. lengths and made of coarse wool with a long nap. The double sets of trays are for the convenience of changing and washing the blankets. The blanket washings can be passed through a simple machine like that described in Phillips' Metallurgy (see page 185), and the tailings from it ground with the coarse concentrations in a Chilean mill.

It is not so much the length of the blankets that separates the gold from the gangue, but the fall, or jump, onto them.

Where the mill has a limited supply of water, and they do not like to go to the expense of a number of concentrators, a coarse concentration may be made with a "Tye Buddle," the plans and directions for the use of which will be found in "Phillips' Metallurgy of Gold and Silver," page 187.

The concentrations from the "Tye" can be passed over the "Frue," one of which would then be sufficient for a large mill, though I am not prepared to say by such means they can work as closely as by using the "Frue" alone.

In case the mill is not situated at a very great altitude, where the frost might interfere with this working,

Amalgamated Plates

In three ft. lengths and two ft. deep, on a fixed frame at an angle of about 3°, to which a slow lateral movement backward and forward of one ft., together with a slight shake, is given, in the same direction with a sprinkling of clean water from a perforated pipe falling on the upper part above where the pulp strikes, might be placed with advantage between the blankets and concentrators.

The Concentrations

Should be sifted through a sieve having 80 holes to the linear inch, and any particles that were not fine enough should be ground in a Chilean mill, the same as described by Mr. Latta, but without using the mercury; and afterwards charged into wooden barrels for amalgamation; but, before charging, the sulphurets should be soaked in water, to free them from all decomposition. I feel confident that larger results will be obtained by thus treating the raw ore than if it was roasted.

The great difference between a wooden surface and a metal one in amalgamation can easily be shown by washing out, say, about one dwt. of Bodie or Grass Valley gold in a batea and then adding, with a dropping bottle, just sufficient mercury for it to amalgamate with, too much or too little will lengthen the result, but if the proper quantity be used by rubbing it with the finger in the center of the bowl it will amalgamate rapidly in less than a minute. Try the same experiment with an iron pan, and you will find how much longer it takes to get the same result. I would strongly recommend any mine adventurer, before erecting any quartz mill, or adopting any particular process, to have some 20 or 30 tons of the rock or vein-stone stamped, and to save, during that operation, a fair sample of the battery pulp from it, which should be carefully concentrated in a batea, or any other utensil used for washing on a small scale. The condition and quantity of the gold, and other ores and minerals, should be tested and examined. The percentage of the sulphurets can also be roughly estimated at the same time and all afterwards compared with the gross results from stamping.

Mr. Edward Booth, the analytical chemist on Sutter street, has kindly furnished me with directions for making a simple test for tellurium, in case telluric gold is suspected to be mixed with the sulphurets. It is as follows:

Test for Tellurium.

"Place in a test tube, or other vessel capable of resisting the action of acids, a small amount of the suspected material, which has been separated as thoroughly as possible from the accompanying gangue. Add enough sulphuric acid to well cover the sample and heat to boiling. If tellurium is present the liquid becomes colored a clear purplish-red."

I have only found, as yet, telluric gold in two mines in Nevada county—one near Grass Valley, and the other, the Murchie mine, near Nevada City.

In my private collection I found a specimen marked "Meadow Lake Ore." I do not recollect who gave it to me, but it contains both gold and telluric gold.

A great deal has been written and said about the

So-called Rebellious Gold Ores

Of the Meadow Lake district, and what the different *process-men* were going to do with them, but I never remember having heard of any careful analysis being made, either of the veinstone or the concentrations. I would therefore respectfully suggest to those who have any samples of the Meadow Lake ores to donate them to the Mining Bureau, as the examination and determination of them would be of the greatest importance to the mining interests of the State. The mines were discovered, I think, in 1862, and in 1865 and 1866 eight quartz mills were erected, a large town built, estimated to contain 5,000 inhabitants. Now the place is quite deserted. See MINING AND SCIENTIFIC PRESS, June 21, 1873.

In the published reports of the Geological Survey, 1864, by Prof. Whitney, no mention is made of the mines or district, so that little could have been known about them at that time.

I can only now add that had I years ago acted upon what I now suggest to others, I would have saved large sums of money for myself and others.

The Pan System.

For instance, what is the difference between the gold and sulphurets in the Mammoth lode, Mono Co., and in the Sierra Buttes lode? Is not the gold in the latter much more difficult to save, and would not the Comstock soda, salt and pan system, if introduced at the Sierra Buttes mine soon close it up like the former? For my own part, I firmly believe that if the same pan system were used in the Victoria district, Australia, all the mines using it would soon cease to pay dividends; and also, if the Idaho mines at Grass Valley, were to try it, that their dividends would soon be reduced one-half.

If the correct number of tons of mercury, soda, salt and "other chemicals," as they are called, that have been sent to the Mono County mills were published I am afraid it would appear to be very large.

It might be argued that the chemicals used in the Bodie mills, were for the extraction of the silver from the ores; in that case it would be exceedingly interesting to ascertain the expense, and see if it did not, as some think, cost $2 in coin for every $1 in silver so obtained.

It is, perhaps, unnecessary for me to say that I am neither directly nor indirectly, interested in any process or patented machinery for extracting the precious metals, nor yet in the sale of any book on the subject, and though I do not wish to be discourteous, nevertheless, I must decline replying or having any public controversy with those who have; as I do not like the idea of favoring such a cheap mode of advertisement. For the same reason, should my health, or other circumstances admit of resuming my old profession, I should cease to write any more papers on the subject for publication.

The following is a

Catalogue of the Specimens

Which I shall place in the State Mining Bureau to illustrate this paper:

No. 1—Crystal of pyrite on a glass slide. Some of the faces are very finely and beautifully gilded—so fine indeed that it requires an inch objective to see it to advantage. From the Eureka mine, Grass Valley.
Nos. 2, 3 and 4—Gold, in little drops or specks, imbedded in the pyrites. From El Dorado county.
No. 5—A specimen of arsenical pyrites with gold. From a mine near Nevada City.
Nos. 6 and 7—Sections cut from the same, in which the gold is easily recognized.
Nos. 8 and 9—Gold, with telluric gold
No. 10—Section cut from same.
No. 11—Gold in carbonate of lime. Eureka mine, Grass Valley.
No. 12—Gold in talcose slate. Taquarilla mine, Brazil.
No. 13—Gold in talc. Placerville.
No. 14—Gold on talc. Brazil.
Nos. 15 and 16—Gold in Itacolinga (micaceous iron). Gongo Soco mine, Brazil. The Itacolinga veins are from a few inches to many feet in width.
Nos. 17 and 18—St. John del Rey veinstone; 18 is about the average of what was milled in 1866.
No. 19—Specimen of kidlas from St. John del Rey mine—a rock which forms the sides of the lode, but also contains considerable pyrites
Nos. 20, 21 and 22—Sections cut from St. John del Rey veinstone for microscopic examination.
Nos. 23 and 24—Sections cut from the kidlas.
No. 25—Yellow, dusty matter, mixed with gold, taken out of one of the richest pockets ever found at Grass Valley.
No. 26—Veinstone with gold. Bodie district.
No. 27—Gold in country rock (diorite). From Nicaragua.
No. 28—Gold in quartz crystal.
No. 29—Gold in syenite.
No. 30—Section cut from No. 29.

I have cut a great number of sections from the St. John del Rey veinstone but could not detect the gold in any of them, and unless very great care is taken the batea test will hardly show any gold, notwithstanding which, on a large scale, they obtain better results from the amalgamation of the raw sulphurets than any other process I have seen tried.

I have just received a copy of the report of the Port Phillip company, Australia, published Jan. 13, 1881, by which it appears the

Tribute System

Has been introduced there with great success. Too much can hardly be said in favor of such a system, as it places the hard working and intelligent miner on a much more respectable and independent footing, and though he, in a measure, shares the risks, but only so far as his judgment guides him, he gets the benefit of any discovery he may make; it also encourages him to study the peculiarities of the lode and enclosing rocks, besides, which, by that system, all are jointly interested in the welfare of the mine. Many of the mines now idle in this State could be worked profitably under the system, particularly in the Bodie district.

In the Port Phillip report it says:

"The number of tributes has averaged about 200 during the year, which shows no decrease when compared with the preceding year.

"The tribute system has been further extended by an arrangement with the tributers to drive the levels in the ground let to them, the company assisting them with driving timber and rails, and making an allowance per fathom until the yield reaches 6 dwt. per ton, when no further assistance is given; the company receiving half the gold obtained and deducting from the allowance the cost of tramming; by this means a large amount of driving is done at a comparatively small cost."

The number of tons of quartz stamped on tributers' account for the year was 48,184 tons. The average yield of the entire quantity raised was 5 dwt., 5½ grains per ton (say $5).

Total Receipts	£32,364 14s 7d
Expenditure	26,310 10s 7d
Leaving a profit of	£ 6,054 4s 0d

In conclusion, so thoroughly am I convinced of the great benefits that would result to this State by a more general introduction of the tribute system in an extended form, both to the placer, as well as vein mining, that I wish particularly to call your attention to it, so that, through the influence of the Bureau and PRESS, the subject may be brought in a proper light before the owners of mines or claims. A fair tribute will secure the *muscle* of the working miner, who, in too many cases, understands better than the superintendent (generally a man of business) how to conduct trials for ore, and afterward to develop them. The *muscle* of the skilled miner is in every respect better than foreign capital.

There is no need of the hard-working miner to leave this healthy climate in search of employment, if those who own mines that are now idle, would let the fact be known through the press, and at the same time offer a fair tribute for working them.

"Driven Wells."

A New Mode of Reaching the Earth's Hidden Waters.

The San Francisco *Morning Call* of Oct. 21st contained the following suggestive article:

Cheap water of a good quality is just now attracting so much attention in this State, where irrigation is a vital necessity, and in San Francisco especially, where rates are high and the water bad, that anything new connected with well-sinking, is looked upon with interest. Therefore the announcement that George Babcock would exhibit Green's patent driven-well combination at Shell Mound Park, attracted to that locality a number of capitalists and prominent agriculturists yesterday afternoon. The engine and pumping machinery were placed in the field to the right of the railway track. Of late years, more especially within the last three years, artesian, or, more properly, bored wells, have been drawing much attention. There has been one plausible argument advanced, however, by its enemies, that contaminated surface water flowed down between the casing and pipe and rendered the wells impure. The claim of the inventor of the driven well is, that that well is free from surface water. The mode of sinking it is as follows: An inch and a half hole having been drilled into the ground to a depth of six or ten ft., an inch and a half iron gas-pipe is driven down, in sections, by strokes from a heavy maul. By this means, a depth of 100 to 150 ft. may be attained. The lower end of the lower section of pipe is perforated. A smaller pipe, but three-quarters of an inch in diameter, to the end of which a drill is attached and above which are perforations, is then forced down into the pipe, and water forced down by a hand force-pump. Turning the inner pipe then loosens the inner core of earth, which is puddled by means of the water forced down the inner pipe and forced out of the larger or outer pipe in the shape of thin mud. By this means the inch and a half pipe is cleared. It is then withdrawn by means of jackscrews, and replaced by a similar pipe, the lower section of which is provided with a point, above which is two ft. length of perforations protected by a brass sieve. The pipe is then driven down to remain. The aim, according to the explanation of Mr. Babcock, is to sink the well until an "upflow" of water is struck, which is to be found generally in a stratum of gravel. The "upflow" stream is always free from surface water. Then the pipe being tightly enclosed, tamped as it were by the surrounding earth, is sealed to all practical purposes. At the bottom of the well, in a short time, all the loamy material is drawn into the pipe and expelled, leaving a "well" of gravel. This well is said to average 10 ft. in diameter. The well being airtight, atmospheric pressure is not to be contended with, but is rather an aid, for by its pressure upon the earth and exterior of the well and water in the bottom of the well, it tends to force up the water, so that when, as in an ordinary well, a pump-rod can be but about 27 ft., in this style of well five to ten ft. may be added. The mode of driving the well is not the only point covered by the patent. The inventor has originated a method of combining a number of one-and-a-half-inch wells into one, all acted upon through the main pipe. Thus, at Shell Mound, ten wells have been sunk in a line, each ten ft. distant from the other longitudinally, and 12 ft. distant laterally. The well beds are supposed to widen out to meet the cylinder, or circumference, of the next well, so that each will have about ten ft. diameter, or in all something like a 50-ft in diameter well. When the pump was started up, the four-inch main, into which each individual pipe led, discharged a full head of water with considerable force. These wells, as it appears from the circular, have been in use a dozen years or more in the East, but not in the combination form. Over 500,000 are in use in the Eastern States. A number are in use in the southern portion of this State, but surreptitiously. It is said that these wells may be sunk and supplied with a hand-pump for $1 the foot sunk. The wells at Shell Mound vary in depth from 30 to 50 ft.—the average being about 35 ft. They are worked by a powerful steam pump.

Tombstone District.

The Mines and Prospects.

[By our Special Correspondent.]

EDS. PRESS:—Leaving Silver district, we took a sailbost down the river. For fear the wind might fail, a Yuma Indian acted as engine. Fifteen miles above Yuma we land and make a slight trip of a mile from the river, to examine and take drawings of hieroglyphic rocks on the California bank of the Colorado. The same kind of rude figures exist on the granite rocks near Woodfords, Carson canyon, and nine miles southwest of the town of Healdsburg, Sonoma county. The figures found at the above places were evidently made by the same Indians.

At Yuma we resumed our journey, passed Casa Grande where we waited two hours, on account of a runaway freight train having the track. We viewed the huge adobe structure known as Casa Grande in the gloom of the night and early dawn, but as so much has been written of this ancient building we desist.

The Silver Bearing Belt at Tombstone.

The silver bearing belt embraces an area of about six miles east and west, by about three miles north and south. The Mule mountains are on the south, the Dragoon, on the north and northeast, the Whetstone on the west, and the Huachuca mountains on the southwest. The country rock is porphyry, quartzite, lime and granite. The ores carbonates, chlorides, sulphurets, with much white and green horn silver.

As depth is attained the lime gives out, and porpbyry and quartzite become the predominating rock. The ores are worked successfully by simple mill and pan process, 9% and upwards being the result. The deposit presents all the appearance of being an infiltrated sea or blanket lode, and this opinion is still further strengthened by visiting all the shafts sunk on the district, where larger or smaller deposits are found, after attaining a certain depth.

The lode is a blanket vein—fissure veins being the exception, if they exist at all. [The output of the mines may be found in the tabulated statement which we print on page 398.—EDS. PRESS.]

The Girard Mining Co. is at present building a fine 20-stamp mill, on their own ground, just above the hoisting shaft. It has pans, settlers and all modern improvements. Water from the Sulphuret will be used, so we were informed.

Fourteen of the principal mines have hoisting works, and good machinery.

The Tombstone Mining Co.

Is one of the leading mines. The ore is found in spar and silicate of lime; runs from $50 to $100 per ton. The company has two mills—one 10 stamp, the other 20 stamp—on the San Pedro, 10 miles away, where the ore is hauled in wagons. This mine has paid dividends from the start. Its ore body extends under the town of Tombstone.

The Grand Central

Was incorporated under the laws of Ohio, with a capital of $40,000,000. They have a vein, from 10 to 12 ft. wide, that runs from $50 to $100 per ton. The main shaft, over which is built the finest hoisting works in Arizona, has a depth of over 500. The company has a mill of 30 stamps located at Contention City, about 11 miles from the mine. [When this article appears, the A. T. & S. F. railroad will have been completed to that point.] The grounds of the Western, now the Contention Con. Mining Co., comprises the Contention, Flora Morrison, Sulphuret—the company's lands.

Head Center.

This company's lands adjoin the Contention, in fact a suit in regard to certain rights is now pending between the Contention and Head Center. The Head Center is incorporated under the laws of California, with a capital of $10,000,000 in 200,000 shares.

The ore vein has a width of from four ft. to eight ft., working about the same as those mentioned above. About 45% of the bullion is gold. We saw at the office of the company specimens of porphyry flecked with particles of gold, spangling the rock most beautifully. Some extraordinary rich ore has been taken from this mine very near the surface.

The company has a 10-stamp mill on the San Pedro, near Contention City. The main shaft is down 600 ft. Hoisting machinery of the best stands over the shaft.

The Girard.

In the same locality, has a shaft over 400 ft., with a vein of ore of five or six ft. in width, which mills about the same as the mines mentioned above ($50 to $100). There is said to be a large body of ore in this mine, but we did not enter the mine, nor one along the belt of paying mines. We have visited the locality twice, and on both occasions a personal examination was denied. A fine mill is now in course of construction. This company is incorporated under the laws of New Jersey, with a capital of $2,000,000, in 200,000 shares.

The Vizina,

Incorporated under the laws of New York, capital $5,000,000, in 50,000 shares, has three shafts, the deepest being 400 ft. The hoisting works, which are good ones, with light machinery, stand within the town, and the principal ore body extends north, underlying the town.

The Empire,

Also on the same belt of mines, incorporated under the laws of Massachusetts, has a shaft down 450 ft., with good ore, so it is said. We did not examine it.

The Bob Ingersoll

Lies to the west of all the above mines, some 2,000 ft. The shaft is down 250 ft.; has a horse and whim. They have 2,000 or 3,000 tons of ore on the dump, and contemplate building a mill soon. Ore is being taken continuously from the mine, but none is being worked. That which has been worked at the Boston mill went $100 per ton—picked ore. The ores are chlorides and carbonates.

All the country lying between the Ingersoll and the Contention and Toughnut mines is supposed to contain ore. There are many prospect holes scattered over the locality, being now simply worked for assessments, and no great depth has been attained. West of the Ingersoll, about one mile, the Stonewall has some fine ores, the gangue being manganese (black oxide). The property was lately purchased by the Boston Mill Co., the consideration of sale being $100,000.

Grand Central South

Has a shaft down 250 ft., and a large body of ore, so said. Is a San Francisco company.

Tranquility

Joins the Girard on the west; has large, expensive hoisting works, and some ore.

The Lucky Cuss

Has produced some of the richest ore yet found in the district. Has a shaft 300 ft., with drifts of 500 ft., not working at present.

The Wedge

Shaft 100 ft.; vein three ft., with rich gold ore.

Gilded Age

Covers a large part of the town site. Shaft down 100 ft.

Mountain Maid

Underlies the town site. There are many other lodes of lesser note, as the Owl's Nest, Junietta, Silver Bell, Monitor, Merrimac, True Blue, Lucknow, Delhi, Miami, Franklin, Randolph, Red Top, Argenta and others. Some ore has been produced from all of them, which works about $50 to $60 per ton.

We visited all the following mines: The

Emerald

Has several hundred tons on the dump; width of lode 3 ft., shaft 100 ft. Horn Silver is abundant in the green carbonate ores of this mine.

Riley.

Shaft 60 ft.; 40 or 50 tons of ore on the dump; ore looks well, chlorides and carbonates of copper and lead.

Verde

Has shaft 106 ft., small amount of ore on the dump. Ore was found from the grass roots down.

Little Pedro

Is on the same line as the Emerald, about one-half mile south. Ore found on the surface in a precipitous limestone bluff. Found in small veins, patches and bunches with small veins of four inches to a foot or more, is a good indication of what may be found below. There are several shafts of slight depths on the ground.

Big Pedro

About the same as the above, on the same hill.

Bonanza.

Shaft 75 ft., some ore which assays from $50 to $150 per ton.

Anchor Mine.

This company has an inclined shaft 180 ft. deep following the ore from the surface. A tunnel has been run intersecting the bottom of the shaft where a body of ore of some extent now exists, and is being taken out and piled on the dump. The ledge material is 7 or 8 ft. in width, with smooth line foot wall but no banging as yet. The ore is mixed with black oxide of manganese the same as the Stonewall, on the line of which the lode is located. The mine is a promising one, and a large amount of ore can now be taken from the mine; there are several hundred tons on the dump.

The company is a Chippewa Falls, Wisconsin, one. The officers are, L. C. Stanley, Pres.; S. B. Strong, Vice; L. M. Newman, Sec.; V. W. Bayless, Treas.; Supt., A. H. Bayless.

Prompter.

This company are grading to put up steam hoisting works. The main shaft is down 200 ft. with other shafts of various depths. Ore seems to be abundant in this mine near the surface. The mine is on the same lode as the Stonewall, which we think it joins. The ore body in the shaft is from 15 ft. to 25 ft. The above is an Arizona incorporation, President, Col. A. Lewis.

Obligations.

We are under many obligations, both on the present visit and the previous one, for many fine specimens from the various Tombstone mines, to Mr. F. A. Hunter, assayer, Tombstone. Mr. Hunter designs visiting Sonora in a short time. He has visited that locality before and gives glowing accounts of its wealth.

G. M.

TEST FOR NITROUS ACID.—Griess' test for nitrous acid in water is so delicate as to detect one part in 1,000,000,000 of water. The water is acidified, and some sulphanilic acid with some hydrochlorate of naphthylamine added. If nitrous acid is present, a rose-red tint is developed.

Mining Districts of Arizona.

We have prepared the following brief notes concerning various mining districts in Arizona, which will be found of interest.

California District

Is 20 miles south of the Southern Pacific railroad, in the Chiricshua mountains, in a well wooded and watered country. The ores are smelting, carrying much born silver. The veins are large and well defined. The principal mines are the Texas, Continental, Cashier and others.

Turquoise District,

Located at the southern end of the Dragoon mountains, 20 miles from Tombstone, the ores are carbonates and chlorides—smelting ores. There is wood and water to a limited extent. The ores assay from $25 upward. The mines are mostly owned by New York parties. The Defiance, Tom Scott, Star, Bodie, Mono are the principal mines.

Doe Cabezas,

In the Chiricahua mountains near the railroad. The ores in this district are mostly gold-bearing with large deposits of ore. The principal mines are the Jupiter, Silver Cave, Galena Chief, Bear Cave, Greenhorn and others.

Hartford District,

On the southern end of the Huachuca mountains, the ores are heavily charged with copper, and run from $10 to $100 in silver. Wood and water is abundant. Most of the lumber for Tombstone comes from this section, and the Huachuca water company are now laying pipes and constructing a large reservoir on the high hill back of the Contention, at Tombstone, the water to be brought from the above mountains. When this important work shall have been completed, and the mills removed to Tombstone, the low grade ores can be worked at a profit, and the production of bullion largely augmented.

Harshaw District

Is some 70 miles southeast of Tucson, in the Patagonia mountains, which mountains are covered with oak and juniper. The ores are chlorides. The Hermosa is the principal mine. The company have a fine mill at Harshaw, and a vein of ore from 8 to 12 ft. wide. Something like one million has been taken from this mine. The Trench, Hardshell and Blue Nose are other mines with the Alta on which extensive workings have been made.

Washington District

South of the Harshaw a few miles, and near the Santa Cruz river, is in the midst of a heavily timbered region on the southern end of the Patagonia mountains. The ores are argentiferous galena, the percentage of lead being great. The ores are generally of low grade but large deposits. The Davis is one of the carbonate lodes which has in some places a width of over 20 ft. The Belmont and San Antonio are the oldest locations, and but two or three miles from the Sonora line.

The Holland, Washington, or Washington Pool mines, embrace 8 or 10 mines.

The geologist, Palfery, years ago wrote up, and remained some three years, in this section attempting to work a mine, but was driven out by the Apaches. The 'Old Mowry Mine," four miles from Washington Camp, was worked by Lieut. Mowry before the civil war, and gave employment to 400 Mexicans. Large smelting works were erected, but the chimney alone remains to mark the site of the smelter, the Apaches having burned down and destroyed the works. The old shaft was down 350 ft. The ore of this mine carries 40 to 60 per cent lead.

Tyndal District,

To the southward of the high peaks of the Santa Rita mountains, some 60 miles from Tucson. The mines are near the Santa Cruz, with wood and water. There are many mines in this district, but no great showing has as yet been made, but as wood, water and ore are abundant, we see no good reason why, in the future, this should not become a prosperous district.

Oro Blanco.

The ores of this section are mostly carbonates. The Yellow Jacket has a 10-stamp mill. The Warsaw has also a 10-stamp mill and roaster. Ore from this mine has worked $80 per ton. Some $30,000 or $40,000 have been extracted. The Warsaw vein is four ft. wide; carbonate ores.

Other mines are: The Alaska, Peelstick Montana, which is a large lode or deposit of carbonates; Idaho—ore from this mine assays as high as $200; Susan, California, and others.

Empire District

Is seven miles from the Southern Pacific railroad, and midway between Tucson and Benson. The Total Wreck is the principal mine, and the one that has of late brought the district into notice. It is an immense body of chloride ores, of 50 ft. in width; the ore also carries gold; is supposed to be a contact vein, between porphyry and lime. The formation is about the same as Tombstone.

Old Hat District,

On the Santa Catarina mountains, near the north end, is a few miles from Benson. Wood and water plenty. Has some promising lodes which assay from $50 to $200 per ton.

Santa Rita.

The above mountain, besides its lodes of gold and silver ores, has immense lodes or deposits of copper ores, carbonates, copper glance and the rich red oxides. Hundreds of acres are covered by the croppings. And the copper deposits of the Silver Bell district, some 50 miles west of Tucson, are among the largest found in the Territory. Expeditions to the not distant Mexican State of Sonora return and give glowing accounts of the mineral wealth of Sonora, exhibiting exactly the same character of ores found in this and other districts in Arizona. The dream of wealth always lies beyond the distant blue mountains, and the restless miner passes in disdain over districts of immense wealth, across the line of his own country, over the cactus-clad hills, in search of the phantom wealth which still lures him on over range after range of mountains and parched plains, only to return to the fields of his former labors a "busted" but wiser man.

Pioneer District

Has been made famous by the discoveries of the Silver King. The vein crops on the summit of a low hill, in a basin surrounded by mountains. During the Apache war a soldier discovered the mine, so said. The ore is a sulphuret, carrying large quantities of native silver. The company has in its office at the mine some magnificent specimens of native silver as taken from the mine. In places the ore body is near 100 ft. wide. Five miles from the mine, at Pinal, is the mill of the company. The ore is worked by the lixiviation process with success.

The North and South King are extensions. Eastland and Last Chance, Mount View and Alice Bell are mines of the vicinity.

The Belcher, with a 10-stamp mill, the Eureka, Surprise, Gem, Lewis are mines of importance and rich prospects.

The Silver Queen, the first location in the district, is a promising mine, owned by Californians.

Mineral Hill.

Mines and rumors of rich mines in the above district are constant. The district is a granite one; the ores smelting; veins large and rich in carbonates and galena. They also carry gold. The Gila river runs through the district, and wood is plenty.

Quarjata.

This district lies six miles south of Casa Grande, where are some very rich chloride and horn silver ore from mines lately discovered in this section. Wood is plenty but water scarce, but can be had in quantity by sinking in the dry bed of the Santa Cruz river, which is supposed to flow into the Gila beneath the desert sands.

Globe District.

There are many promising mines in this district. The rock formation of the country is granite, both true, and syenitic porphyry and quartzite, limestone and slate. Wood is comparatively plenty for years to come. The principal mines are Irene, Alice, the former a New York company, the latter the property of the Globe M. Co., Centennial, Stonewall, California, Miami, Golden Eagle, Centralia, Independence and many others. The ores are generally free milling, with some copper. Much of the ore was formerly shipped to San Francisco for reduction. It may be said to be a promising district.

Richmond Basin,

Fourteen miles north of Globe on the west slope of the Apache mountains, has wood and water in abundance. This section is famous for its large nuggets of pure silver. Something like $80,000 of the metal is said to have been picked up. The ore found here is native, silver glance, and bromide. The McMorris is the leading mine, has a vein eight ft. wide, the main shaft is down 450 ft., with inclines and tunnel of 800 ft. more. Something like $400,000 has been extracted from the mine. The company have steam hoisting works and a ten-stamp mill. There are other promising mines here. There are also rich mines at McMillenville, about 20 miles north of Globe, on the line of what is believed to be an immense fissure in the granite, as it is traceable over the mountains for a great distance. Wood and water abundant. The Stonewall has produced some native silver—has steam hoisting works. The main shaft is down 600 ft. and there are 1,000 ft. of drifts. A five-stamp mill is one of the fixtures. Copper is also found all over the mineral region of Gila county.

Prescott Mining Districts.

The various districts around Prescott and in Yavapai county, which are known to be rich in minerals, will soon be placed within easy communication with the outside world, by the completion of the Atlantic & Pacific railroad. By this road, a vast extent of country will be developed and the mineral wealth of her mountains opened to capital-seeking investment.

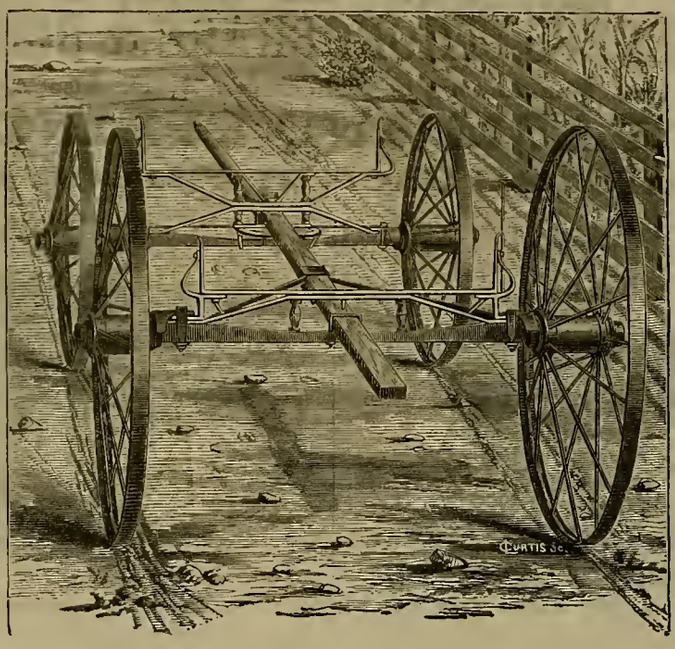
The districts of Hassayampa, Walker, Tiptop, Big Bug, Groom Creek, Cherry Creek, Martinez, Weaver, Black Canyon and others will be given a new impetus, and the large amounts of low-grade silver and gold worked successfully. Its great distance from the South Pacific railroad has worked somewhat against the county, but in the near future the mines of the above districts will be heard from.

On the San Francisco river, rich gravel deposits exist, and salt exists along the river of that name in immense deposits in the bluffs, and salt lagoons are found along the line of New Mexico in Apache county. Coal is also found along the Little Colorado river, which extend into New Mexico and Utah. They are said to be extensive deposits.

AN attempt was made to burn the Day furnace, at Bristol, Nev., recently.

THE SWEEPSTAKE IRON WAGON.

Important Advantages Over Wooden Wagons



Which we think we can justly claim for it:

1st. The material of which it is made is equally unaffected by the hot, dry climate of our interior valleys, or the cool, wet weather of the coast.

Experience has shown that it is almost impossible to make wooden wagons stand in valleys like the San Joaquin, the heat of the sun and the drying winds seeming to destroy the life of the timber, causing them to fall to pieces.

In this respect we feel confident that this wagon is just what has been long needed.

2d. The tires will never require setting, but will simply have to be renewed when worn out, as the wheel can never become "shackly," nor can the spokes get loose in the hub. This alone is many men would make the wagon of twice the value of a wooden one.

3d. The entire Wagon will last (if the tires are renewed) till the spindles are wornout, and the repairs on it will be next to nothing.

For the above reasons we claim that we are offering to the public the best farm or freight wagon yet made.

They have been severely tested in every possible way, and the result has fully justified all we have ever claimed for them as to

STRENGTH, DURABILITY,

Lightness and Ease of Draft.

They have been used steadily in hot, dry climates for months, and in sections where it rained almost constantly, and in both cases remained in perfect order.

A good many of our wagons were sold last year with the understanding that the purchasers were to test them severely, and they did so, with one unvarying result—proving in each case that they would carry a heavier load and pull lighter than a wooden wagon of the same weight. We are now making these wagons in quantities and have had rolls made at the rolling mills specially for us to make the forms of iron that we require to best secure lightness and strength. For this reason OUR WAGONS FOR THE PRESENT SEASON will be superior to any heretofore made.

We wish to reiterate what we have said before about these wagons being constructed on an entirely new principle as applied to wagons, for it is the chief reasonfor their success.

Iron wagons have been attempted before and have not been successful, but the difference between those made heretofore and ours is as great as the difference between iron and wooden wagons. All iron wagons made hitherto have had a clumsy and heavy appearance, due to the fact that the makers thereof attempted to use the iron just as wood is used—that is, instead of employing the truss principle they attempt to get strength by using large heavy pieces that are subjected to a breaking strain precisely as in a wooden wagon. It is needless to say that the plan resulted in a failure from the fact that when iron of sufficient size was used to obtain the required strength, the wagon became much heavier than a wooden wagon, rendering it useless.

THE BEST FARM AND FREIGHT WAGON IN THE WORLD. LIGHT, STRONG, HANDSOME AND DURABLE.

(Patented March 25th, 1879, and July 1st, 1879.)

THIS WAGON IS CONSTRUCTED ON THE TRUSS PRINCIPLE THROUGHOUT, WHEELS, AXLES, BOLSTERS, AND ALL.

The Cut Shows the Construction of the Wheel,

And special attention is called thereto, as the wheel is the weak point in all other wagons.

A moment's consideration will show that neither a side strain nor a heavy load can affect it unless some of the spokes shall stretch or pull apart, a result that cannot occur with any load that the spindles will sustain.

It will be seen that the load on the axles is carried by the upper spokes of the wheel—in other words, it hangs on them, and were all the spokes in the lower part of the wheel removed, the load would still be sustained.

The bracing position in which the spokes stand—being six inches apart at the base—effectually prevents a side strain affecting it; such a thing as "dishing" being simply impossible.

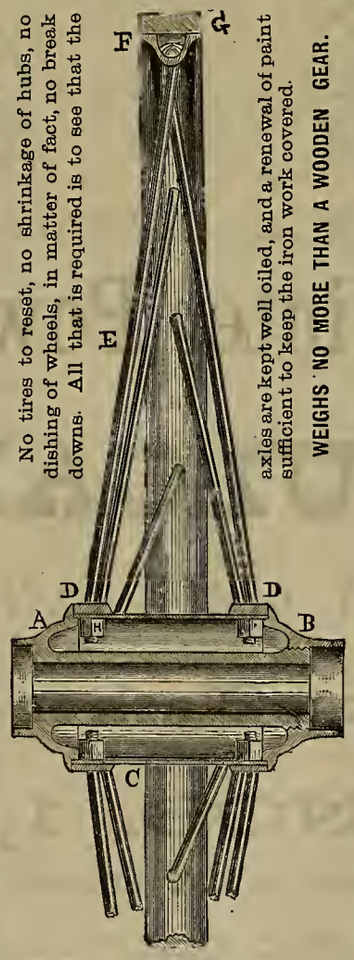
The cut shows the hub of a wheel split open lengthwise through the middle. It is one-sixth the full size of a hub for a two-inch axle. At F and G, the felloe and tire are shown as they would look if cut in two. G is the tire and F the felloe. The shape of the felloe and the way the head of the spoke rests into it, can be clearly seen. E is one of the spokes. For this size of wheel we use half inch round Norway iron, with the lower end (where the thread is) upset so that it is as strong there as anywhere else. We use close fitting, hot pressed nuts, nearly seven-eighths of an inch thick for a half inch spoke.

A represents the box of the hub, and also forms one end of it. B is a cap or flange that screws on the outer end of the box and forms the other end of the hub.

It will be seen that the two flanges, A and B, screw up close to the nuts on the spokes, thus locking them and preventing them from turning or getting loose.

At the same time the box, A, and the flange, B, are independent of the rest of the wheel, so that if a box should become worn, it can be replaced in 10 minutes by the teamster without resorting to a blacksmith or wagon shop. They are all made to gauge, so that any box will fit any wheel hub made for the same size of spindle. C represents the shell of the hub. It is made of wrought iron pipe, and is surrounded at each end by wrought iron bands, D, D, shrunk on. The spokes pass through these bands as shown.

The felloe is a solid ring of *wrought* iron, of the shape shown at F. Take particular notice that it is *wrought iron*—not *cast*, as many are lead to suppose from its shape. This is a wrought metal wagon. Cast iron is used only for the axle boxes and the sleeve through which the reach runs. The tire of the wheel is shrunk on in the usual manner and riveted. The wheel, when complete, weighs no more than a wooden one for the same sized axle and is not less than four times as strong. We think that men who understand the amazing strength of a wrought iron truss will agree with us, after examining the foregoing cut, that this wheel is the most durable, strong and perfect wagon wheel that can be made in the present state of the mechanic arts. There are two parts of this wheel that will wear out, and two *only*. These are the tire and the box, either of which can be easily replaced. *The rest of the wheel will last a life-time.* As it can neither shrink in dry weather nor swell in wet, the tire will never get loose and will never require resetting, but will simply have to be renewed when worn out. This immense advantage alone is sufficient to justify our assertion that we are making the most perfect wagon known, but there are also advantages connected with the construction of the gearing that are almost as great as those of the wheel.



G
F
E
D
D
A
B
C
No tires to reset, no shrinkage of hubs, no dishing of wheels, in matter of fact, no breakdowns. All that is required is to see that the axles are kept well oiled, and a renewal of paint sufficient to keep the iron work covered.
WEIGHS NO MORE THAN A WOODEN GEAR.

FULLY WARRANTED.

This Wagon is found upon trial to run more easily than a wooden one, owing perhaps to its great rigidity, preserving the wheels in a position perpendicular to the axles.

We discovered when we first made this Wagon that it moved with great freedom and ease under a load, and the teamsters using it declared that it ran easier than a wooden one, but we could hardly account for it, except on the theory before mentioned; but one of our customers, Mr. R. S. CLAY, of Merced, explains the matter in a manner that makes it clear. He says that it is because the wheels have neither "dish" nor "gather," but stand plumb and true, and as he expresses it, "makes a square track in the dust," while a wheel having "dish" and "gather," makes a kind of plowing movement. "Gather" is a technical term used by wagon makers to denote a peculiar way of setting the axles by bending their ends a little forward, so that the distance between the front part of a pair of wheels is less than that between the hind part.

It is given wheels to make them crowd the shoulder of the spindle instead of the nut, and if given scientifically and in just the right degree is beneficial perhaps; but if carried beyond a certain point—as it often is—it adds *very much* to the draft of the wagon.

To illustrate this idea, let us suppose the "gather" to be so great that the front part of a pair of hind wheels is close up to the bed while the hind part stands off a foot. It will be seen at once that the result would be that the Wagon could hardly be moved at all with a heavy load.

Again, it adds greatly to the draft of the Wagon if it has either too much or too little "set." If too much, the wheels stand under too far; and if too little, they straddle apart too much, in either case creating undue friction on the axles and wearing out the boxes rapidly.

The easiest running vehicle in the world is one whose wheels stand perpendicular, whether loaded or empty, and in an exact line fore and aft, like those of a locomotive, and that is just the way the wheels stand on our Iron Wagon.

Before the axle can yield, except at the shoulders, it must pull apart—a manifest impossibility—and before the bolster can give out, it also must pull apart the bar forming the upper cord of the truss. Herein is the secret of the success of *these* Wagons, while *other* iron wagons have failed. When wrought iron is used, so that it is subjected to a bending strain, it has very little strength comparatively speaking, but when it is so used that the strain comes endwise it can hardly be pulled apart. We have carried some tremendous loads on these Wagons, but do not claim for them that they will stand much more dead weight than any other iron axle wagon—though they will some, because the axle is so made that the strain or weight of the load comes close up to the shoulder; but we do claim that the wheels and gearing are strong enough to carry *double* the weight that they are recommended for.

A two-inch wagon in use by J. L. Kirkham, at San Leandro, has repeatedly, during the past two years, carried loads of coal and iron, weighing over 7,000 lbs.; and on one occasion he brought from San Francisco to San Leandro, on this same two-inch wagon, *a load of 9,000* lbs., as shown by the Ferry scales. But this is excessive as well as useless and foolish. Many persons have used our two-inch wagons steadily under loads ranging from 6,000 to 7,500 lbs.; but we do not claim any such carrying capacity for them. From 4,000 to 5,500 lbs. is enough on any ordinary road for a two-inch spindle.

IRON HEADER WAGON GEARS.

We manufacture for the harvest season a large number of IRON HEADER WAGON GEARS—1⅝, 1¾ and 2-inch axle, with 3 ft. and 3 ft. 10 inch wheels, tire from 3 to 4 inches wide, and if desired to make Farm Gears of them, can furnish 4 ft. 10 inch wheels. Having made important improvements within the past year, the Wagon, as now manufactured, is perfect in all its parts, and we anticipate an active trade. Orders should be sent in early to insure prompt shipment. Lack of space precludes our giving a more extended description or insertion of numerous testimonials. *SEND FOR CIRCULAR AND PRICE LIST.*

We can supply an EXTRA OUTSIDE TIRE IN SECTIONS, to go over the regular tire, which will save its wear, strengthen the wheel, and can be renewed at any time and at small expense, as compared with welding and resetting; or any person can put it on without the aid of a blacksmith.

We have encouraging and very satisfactory reports from all who have used the wagon, and strong testimonials from some of the most prominent men and farmers of this coast, among whom we would mention a few: Hon. John Bidwell, of Chico; Benj. R. Crooker and Mike Bryte, of Sacramento; A. Wolf and A. McCloud, of Stockton; R. S. Clay and W. P. Colman, of Merced; J. J. Fulton and Messrs. Germain, Montgomery & Co., of Benson, A. T.; Isaac Perkins, of Modesto, Cal., and many others too numerous to mention. Address,

New Mexico.

Its Mines and Resources.

The mines and unoccupied lands of New Mexico are just at present attracting the attention of the Eastern capitalist and the outside world in general. Having visited the principal part of the Territory, we give the following brief description of some of its mines and mesa lands: From the time we pass through the tunnel at the Raton Pass, leaving the State of Colorado behind, and emerge into New Mexico, to where we pass out of it over the Membres mountains into Arizona, the country is full of interest and minerals.

On the flanks of the Carrillos, Ortiz and Tuerto mountains, along the slopes of the Gallinas Ladrones, Mogollons and Black Range, evidences of mineral deposits of greater or less extent are met with.

Rich gold-bearing rock is found in the Oscuras, near White Oaks, and chlorides, carbonates, native and horn silver in all the mountain ranges.

On the 25th of Sept. of the present year we left the city of Santa Fe, for a trip to the great mesa beyond the San Pedro mountains, and to view the mines along the Cerrillos and Ortiz chain. Our route for twenty miles lay across the mesa to the south, a gravel plain of little or no value. The rainy season had but just closed and the plain was flecked with the most beautiful flowers. Cactus of many varieties, laden with crimson and yellow fruits, daisies of two or three hues; clusters of petunia, gigantic sunflowers—indeed this appears to be the home of the sunflower. Mesquite bushes, palo verde shrubs, with their limbless branches full of small leaves, clustering closely to the body of the shrub. These extraordinary trees, with their green cork-like bark and sharp thorns, only hold their leaves but for a few weeks during the rainy reason, at other times they appear as dead stalks, gnava, amole or soap plant, the yucca with bayonet-pointed leaves, grama and bunch grass make up the vegetation.

The Santa Fe creek crosses this mesa flowing south, emptying into the Galaesteo creek, which in turn empties into the Rio Grande 30 miles away. These rivers contain no water except in the rainy season.

Bounding the mesa on the south the cone-like peaks of the Cerrillos rose above the plain to a hight of 500 or more ft., covered with a sparse growth of juniper and pinyon pine.

Tangled masses of thorny cactus lined the road, an occasional rude cross, surmounting a pile of stone, marked the spot where some life had ended at the hands of the murderous Apache. A conical hill, crowned by a tall cross, stands on the verge of the mesa, the advance guard of the mountain chain.

One mile from this point we reach the town of Bonanza.

Here reduction works are being built, a smelting furnace of the Duryea plan was in operation.

The Ore Obtained in the Cerrilloe,

Is argentiferous galena, which contains in addition zinc, antimony and iron. The ore is not of high grade.

Two miles further on, near the summit of the chain, we reach the town of Carbonateville. Near this point is located the Aztec Turquoise mine of "Chalchuitl." There we see the evidence of long years of labor in the deep excavations and great dumps of refuse from the mine, now overgrown with large trees, some of which are two feet in diameter. There is no historical date of commencement to mine for the mineral, though it is more than probable that long before the Spaniards conquered and forced the natives to mine for the mineral, the descendants of the Montezumas wore the gem for ornaments.

In 1680 the Indians revolted and threw off the yoke of Spanish authority, drove their task masters from the country and filled up the mines they had been compelled to work. The Turquoise mine was not abandoned until a cave buried 25 of the natives.

A large cross stands on the hill, or what is left of it.

The reopenings of the mine disclose old passages, blackened with smoke. These workings are curiously made; deep shafts showing no marks of drille or powder, yet in rock hard enough to require them.

The stone hammers found in the drifts and workings, show what rude means were employed to mine for the gem. Here are the ladder ways, poles notched for steps, reaching from one rock stage to another, up which the toiling peoned Mexican, or Pueblo Indian, carried the dirt and ore in rawhide sacks on their heads. The Indians, at the present day, regard this mine and the beautiful gem found here with a kind of sacredness.

The Turquoise Jewels

In the crown of Spain are from this mine, which is the only one on the continent of America.

We clambered through the blackened passages, along the drifts to the farther end, where we found the ore in place. It penetrates the country rock—which is porphyry in small seams, the most of the ore being carbonate of copper. The gem is found in reniform or kidney shaped nodules. In reopening the mine some of the remains of the buried Indians were exhumed.

Bits of glazed pottery and fragments of stone hammers are found in the debris of the dumps, to which the Indians of the Pueblo of San Domingo resort and scratch over the ground for bits of the blue gem that may have escaped the workmen.

Several of the Mines

In the vicinity were worked by the Spaniards for silver more than 200 years ago. One, the Mina del Toro, has been worked in step-like courses far below the present level of the water. Notched holes, on which the miners descended, lead down to the water's depths. There is ore in sight above the water line, but to what extent is not discernible.

One is puzzled in viewing this mine, to comprehend how the Indian slave, without powder or drills of any kind, sunk this shaft to the depth we find it.

There are several old mines near this point which have been filled up for some cause.

Leaving the ancient mines, we drove down the dry bed of an arroyo to the town of Cerrillos, a station on the A., T. & S. F. railroad. Crossing the Rio Gallistea, a ride of 12 miles over the foothills brings us to the

Hacienda del Oro,

A stage station on the northeast base of the Ortez mountains.

Here are located the old placers which have been worked for 200 years. There is but little water to mine with, and the dirt has been packed on "burros" for six miles to the water.

Dry washers have been tried at this point without success.

Thirty miles away, the Pecos river flows toward the valley of the Rio Grande, where water is abundant, but it would have to be brought in iron pipes, as the sands of the mesa would absorb the water, and the intervening plain is lower than the placere. It would cost more than $1,000,000 to complete the work. No mining is being done worthy of note.

Nine miles farther south, over hills covered with a dense growth of pinyon pine and juniper, we reach the new placers.

We find at the base of the Tuerto mountains the most extensive deposits of placer gold, and in the mountain, the largest deposit of gold, silver and copper ores to be found in the Territory. Hundreds of shafts and shallow excavations attest the length of time and extent to which they have been worked.

There is no water, and what dirt has been washed, was packed to water, or the water hauled in hogsheads to the mines.

An Iowa company is to make the attempt to obtain water by boring. No work is being done on the placers. In the mountain range, many seemingly rich lodes are being worked.

The San Pedro Co. have the most extensive reduction and smelting works in the Territory located at this point. They consist of a 25-stamp mill and two water jacket smelting furnaces.

An artesian well 400 ft. deep supplies the water. Water is being brought from the Sandia mountains, 17 miles away. Iron pipes are used, but as yet not successfully.

Near by is the little town of Golden, about 100 inhabitants.

In 1843 this town had a population of 5,000, who worked the mines now known as the New Placere. Large nuggets were sometimes found, the largest one, of seven lbs.

The Manner of Washing the Dirt.

At that time, the water was drawn by oxen, one dollar per hogshead being paid for it.

The men who worked the mines, received for their services, three buckets of dirt or gravel as pay per diem. From prospects made at the present time, this would amount to about 15 cents.

When the Mexican war commenced, men were drafted from all parts of Mexico, and the the mines of Golden abandoned.

Without water these mines are worthless. It is only from the quartz lodes and mineral deposits, which exist in the mountains, that recompense may be expected. The title of these lands are in dispute, the government having commenced suit to set aside the Mexican grant title. Although this grant was located for agricultural and grazing purposes, there are

No Lands Fit for Farming

On the entire grant. Grass is abundant, but one spring on the land, from which the short mountain chain takes its name, "Tuerto." Lieut. Col. W. H. Emory visited these mines as early as 1846, and in his notes speaks of them.

From these mines the Aztecs procured the gold for their ornaments, and the sight of the large nuggets seen by the early Spaniards at the City of Mexico prompted them to follow their Indian guides to the placers, and found at the base of yon mountain range, 50 miles to the northward, the infant city of Santa Fe. The mountain sides and the mesa at their base is densely wooded, with pinyon, pitch and contorted pine, with juniper and an occasional mesquete. The country rock is granite, limestone and porphyry, with some sandstone and slate. Fossil shells of the upper and lower silurian, devonian and carboniferone periods, are abundant in the limestones and slates.

The mountain ranges throughout the Territory are capped with limestone or felithian deposits, and the lodes generally are what are known as infiltrated sea or blanket lodes. They are horizontal deposits.

Copper

Is very abundant. There are mountains of it in the Oscuras, Gallienas, Ladrones and Mogollons that will yield from 5% to 75%.

From all over the Territory, carbonates, sulphurets, chlorides, native, brittle, horn, ruby and bromides of silver and rich gold quartz is found.

From the summit of the Tuerto mountain we look out over a wide extended mesa. A dreamy haze gave it the appearance of a vast inland sea stretching away to the south for over 100 miles, beyond which rose some low mountain peaks.

This vast plain is

All Government Land,

No claim, as yet, has been laid on its extensive surface. With the exception of some salt marshes near the center of the plain, where the rain collects in the wet season, no water exists. Artesian wells would make this a desirable property (as it is covered with a luxuriant growth of grass), if owned by a company. One hundred and sixty acres would be useless.

The Rainy Season

Commences about the middle of July and ends the first of September, during which time the mountain ranges are swept by the most terrific storms, cloud bursts being frequent. The dry streams become raging torrents, sunshine and rainstorm alternate. The mesas and mountain ranges are quickly clothed in verdure. Flowers of the most beautiful varieties fleck the hillsides, which but a few weeks before gave no signs of life.

Nothing will grow in New Mexico without water, and when the rainy season closes, the hills soon become brown and the brilliant flowers disappear. In the

Santa Rita and Hanover Districts,

Are mines of virgin copper. We saw sheets one-half inch thick by four or five ft. square, which is obtained from a decomposed trap rock.

We saw copper utensils in Santa Fe, said to have been made by the Indians from copper obtained at these mines 200 years ago.

The United States use 30,000 tons of copper per annum, one-half of which is produced by the mines of Lake Superior. New Mexico alone, in the future years, can more than supply that demand.

The remains of old smelters of adobe and the huge dumps at the mines attest what has been done in the past.

In the Pinos Alto district, we also see the evidences of ancient mining in the old arastras and abandoned placer mines.

Three hundred thousand dollars to the ton (?) is said to have been extracted in these old arastras, but its glory like the $300,000 to the ton, is gone.

The Carrizillio District.

Thirty miles south of the Southern Pacific railroad, joining on old Mexico, contains some promising looking lodes, but little development. The veins are in porphyry and granite, and may be traced for miles.

There are many springs of water in the mountains among these lodes, and wood abundant.

New Mexico is yet in its infancy; there are less than 100 stamps in the Territory, one-half of which are crushing. There are seven furnaces, one-half of which are smelting. As we wander over the mountain ranges viewing the signs of hidden wealth, the advancement she has made in the past year, and behold the evidences of the rude mining, drudgery and servitude of 1680, of those who broke rocks with rude stone hammers—unwieldly and awkward—wooden wedges and levers, contrasted with 1881, where we see mines opened on the site of old ones, hear the ring of the hammer and drill, the deep boom of the blast of American enterprise, we cannot believe but it will be prosperous.

We crawl through the windings of these old mines, and listen to the narration of scenes and incidents, or stroll through the pueblo villages along the Rio Grande, where as at Taos, we find the fires burning brightly, on the altare of the descendants of the Montezumas.

The Gunnison Country.—Denver *Tribune:* Heavy snow falls have been frequent of late in the Gunnison and San Juan mining camp. Accounts received yesterday from Ouray county say the snow is from three to five feet deep on the level, and much the same state of things exists in the Gunnison. All prospecting has ceased for the winter of course, and the work of developing the established mines is in many cases suspended. A few, which are well prepared for the siege, will be operated all winter, but it is not probable that any ore will be shipped out to market. Considerable development work has been done in both sections during the past summer, which will be a great value in the general operations of next year. Prospectors have discovered several new mineral belts, which give promise of good returns when methodically opened. It is now more than ever believed that one, and perhaps two, extensive tracts containing lead carbonate ores have been opened. Being on the reservation no great amount of work has been done on them; still sufficient is known to create strong confidence in their ultimate value. Though the bullion yields of the Gunnison this year are light, probably not over $200,000, it is a clear gain of that amount to the State. We may count on a considerable increase from that quarter in 1882.

Resigned.—The Nevada City *Herald* says: R. McMurry, for many years Superintendent for the Eureka Lake Co., has tendered his resignation. Who Mr. McMurry's successor will be is not yet known, but it is safe to predict that it will indeed be a hard matter to find one in every way so competent for the position as Mr. McMurry is. Mr. McMurry has also resigned as Supt. of the Yuba Canal Co. Con.

The Ditch System.

The Nevada *Transcript* says: The ditch lines of the mountains are owned by various hydraulic mining companies, that in some instances find a market for the surplus water they do not need for their own use. Quartz, and drift mines and ranchers buy of them, and the receipts from this source pay a portion of the cost of keeping up the property. We have in mind one company that thus disposes of a larger per centage of its water than any other, reserving only about half for its own use. It pays out an average of $40,000 a year for labor and material in maintaining its canals, flumes and dams and other appurtenances. It realizes only half that amount from sales, but by using the balance of the water in its own mines is able to make a fair profit. If, to-morrow, the company should be compelled to suspend hydraulicing it could no longer afford to keep the water running, as the receipts from sales would be but half the cost of operation. This would shut off the water supply from all its patrons, compelling them to suspend work. This is another illustration of the extent to which the hydraulic mines are the mainstay of this part of the State.

The various lines are owned by companies engaged in this industry, who, after supplying water to drift and quartz miners, ranchers, manufacturers and the like, use the balance in working their own mines. From the sales made they realize but a small portion of the sum required for keeping in repair the lines, but by diverting to their own use all for which there is no market are enabled to realize fair margins upon their investments. Very few people have even a remote idea as to the magnitude of this water-supplying business. The North Bloomfield company owns 157 miles of ditches, costing $708,841; the Milton company, 80 miles, costing $391,579. The Eureka Lake company 163 miles, costing $723,342; the South Yuba company 123 miles; Blue Tent company, 32 miles, costing $150,000. These are all Nevada county hydraulic mine owners. To keep their ditches in repair it costs them from three to three and a half cents per inch each year, exclusive of interest and the capital invested.

Greaterville District, Arizona.

Greaterville district has heretofore been counted a gold camp, but recent discoveries go to indicate that silver as well as gold is to be found, with every indication of a permanent and rich deposit. Greaterville district proper embraces a portion of the east foot hills of the Santa Ritas, and lies to the west of the Empire district and to the north of the Rightson, and not very far distant from either, and as both of the districts named are rich in silver there is no reason why silver should not be found in paying quantities in the Greaterville. We were shown, yesterday, a very rich specimen of ore from the Tenbrook mine, in this district, owned by Tom Belknap, H. C. Wiley and T. McCleary. It was taken from a streak 18 inches wide, out of the bottom of a shaft 20 ft. deep. The ore carries green chlorides, lead carbonates and black sulphurets. The ledge is well defined, in a porphyry formation. The assays show $290 to the ton. Work is being pushed on the claim; the shaft is going down on an incline. The mine is on the eastern slope of the Santa Ritas, on the north side of Hughes' gulch.

Gold placers exist all around the property, and are being worked every day. However, where a well-defined ledge exists, silver predominates. Besides the Tenbrook, the same parties own the Pawnee, Sunset and Pioneer claims. These have all more or less work done on them, and each makes a good showing. The claims lie compact, and, if the ore continues permanent, this is destined to become a property of great value. Besides these claims, Richardson and Robinson own the Yuba and other claims, which are making a good showing in silver. They are also operating on the west side of the Santa Ritas. One of the partners is now in the East, and it is expected on his return to enlarge the field of their operations, and the expenditure of a considerable sum, in the way of development work will follow.—*Arizona Journal.*

The Youngest Leads.—So far this year, the Ontario and Horn Silver of Utah have produced more than any other two mines in the United States. From January 1st to September 30th the Ontario produced $1,862,007, and the Horn Silver $1,264,129, a total for the two of $3,126,136. The only mine, except the Ontario, which has exceeded the Horn Silver is the Standard of Californie, which produced in the same time $1,323,663, or $59,534 in excess. There were only four others that ran a million for the same period—the Eureka Consolidated of Nevada, $1,212,242; the Tombstone of Arizona, $1,140,228; the Western of Arizona, $1,079,212, and the Northern Belle of Nevada, $1,032,026. Aside from the fact that both mines were at considerable extra expense in purchasing and erecting new and enlarged machinery during the past summer, up to the 1st of October for the present year the Horn Silver had paid $300,000 and the Ontario $725,000 in dividends. Though the mining industry of Utah is but in its infancy, and been less favored by capital than its sister States and Territories, it has shown that when its mines are developed they come to the front as leaders.—*Silver Reef Miner.*

GIANT POWDER,

Manufactured under Alfred Nobels' original and only valid Patents for Nitro-Glycerine Powders, which has been and still is of such immense advantage to the Miner, Railroad man and the Engineer. All other Nitro-Glycerine compounds, for instance, so-called Hercules, Vulcan, Vigorit, etc., are simply imitations and adulterations of the original Giant Powder.

The GIANT POWDER Company

Manufacture Three Grades of Powder, which are the

SAFEST AND STRONGEST HIGH EXPLOSIVES IN THE MARKET.

The Original Nitro-Glycerine Gompound

GIANT POWDER
=OR=
DYNAMITE

Is acknowledged by all the great Chemists of the world as unapproached by any other compounds, no matter under what names they may have been placed before the public, for instance, all Chlorate of Potash and Gun Cotton mixtures have been thoroughly tested and ried in Europe, and abandoned on account of their liability to spontaneous explosions.

THE JUDSON POWDER

Is a Black Powder owned and Manufactured by the

GIANT POWDER COMPANY.

It is from **Three to Five times Stronger than ordinary** blasting Powder, and is used by all the **Railroads and Gravel Claims,** as it

Breaks More Ground, Pulverizes Better and Saves Time and Money.

It has therefore superseded the ordinary Powder wherever tried.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE FOR SALE.

Crookes'-Mitchell's Assaying—No. 1.

[Written for the PRESS by C. H. AARON.]

It may seem presumptuous for an ordinary assayer to call in question anything which may appear under the authority of a name like that of Prof. Crookes; but although that gentleman may know a great deal that we do not, there are some things which we are as competent to understand as any scientist, however eminent.

In the recent editions of Mitchell's well-known manual of assaying, by Prof. Crookes, is at least one alteration from the original, which does not appear to be an improvement.

In the article on weighing, the operator is cautioned not to depend on direct weighing unless with a very superior balance, but to place a watch-glass or a platinum capsule on one pan and weigh it. Then to place the substance to be weighed on the watch-glass or capsule, weigh the two together, and subtract the previously ascertained weight of the capsule, which leaves the weight of the object. This is weighing by difference. By proceeding thus, we are told that any errors arising from a want of equilibrium in the balance, or *of equality in the length of the arms of the beam*, are eliminated.

As it reads this is simply nonsense. The effect of the balance being out of equilibrium in the first instance is certainly eliminated by the counterpoising of the capsule, from the simple fact that the balance is thus brought to equilibrium before weighing the substance. The advantage to be gained by *weighing* the capsule, and going to the trouble of an arithmetical calculation in order to arrive at the weight of the object by difference, is not apparent. If the capsule is simply counterpoised by any means, and the object then weighed, the same result is arrived at with less risk of error, which might occur in the useless calculation prescribed. If the arms of the beam are of unequal length, the apparent weight of the object will be erroneous whether weighed by difference or not.

What appears to be meant, but which is not by any means stated, is this: If all the weighings of an assay or analysis are made on the same end of the same beam, a difference in the length of the arms is of no consequence, because it effects the apparent weight of the impure substance and of the purified product in an equal ratio, hence the relative proportions of the weights is not impaired, and this is all that the assayer or chemist usually requires. This is usually the case in regular analysis, and invariably so in bullion assays, in this country at least. With ore assays, however, it is different. The assay balance is never used for weighing the ore for the assay, being too small and delicate for such a purpose. The ore is weighed on the "pulp scales," which are usually sensitive to 1-20th of a grain or less, which is sufficiently accurate for the purpose. The precious metals obtained are weighed on the assay balance, usually an Oertling No. 12, sensitive to one 10,000th of a grain in many cases, and always distinctly indicating 1,000th of a grain. In thus using two separate balances, it is necessary that the weighings should be correct absolutely; in terms of the weights employed and within practical limits, and if there should be a difference between the lengths of the arms, the error thence arising would not be eliminated by operating as directed by Prof. Crookes.

In a reasonably good assay balance there is never any appreciable difference in the length of the arm, but in case such a discrepancy did exist, the effect could only be eliminated by ascertaining its percentage value and correcting each weighing, or by *double weighing*, of which there are two methods, namely, reversal, and substitution.

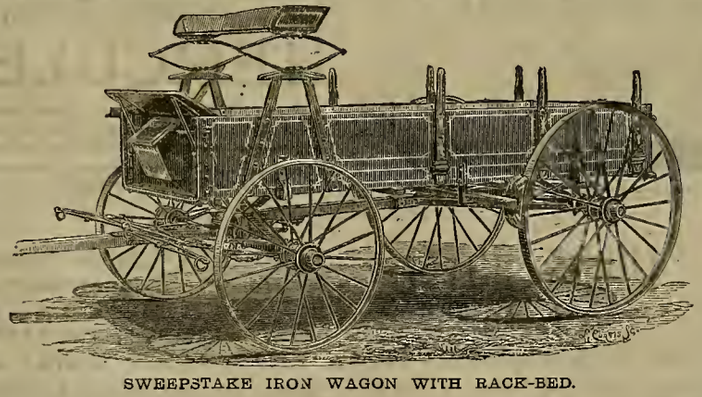
The method of reversal is performed by weighing the object on each end of the beam, the balance being first adjusted to equilibrium, for it must be remembered that the condition of equilibrium is quite a different matter from equality in the length of the arms. The true weight of the object is the geometrical mean of the two apparent weights; but unless the difference is considerable, the arithmetical mean, found by adding the apparent weights and dividing the sum by two is sufficiently accurate. In weighing by substitution, the most convenient manner is to place on one of the pans, one of the larger weights of the set, say the 1,000 (10 grains or 1 gramme), and counterpoise it. The weight is then removed, the bead or other object put in its place, and smaller weights added until the counterpoise is again balanced. The difference between the weight removed and the sum of the weights necessary to restore equilibrium is the weight of the bead. It is best to make a permanent counterpoise for the 1,000 weight, using it, of course, always on the same pan. To weigh out 1,000 of bullion for an assay, it is only necessary to balance the counterpoise with the bullion.

While on this subject, it may be as well to mention that the weight of pure salt which is equivalent to one gramme of pure silver, as given by Mitchell in the directions for the humid assay of silver bullion, is slightly incorrect, according to the atomic weights given in the same book. Instead of 0.5427 grammes, it should be 0.5416+. A similar error occurs in the directions for the humid assay of lead ores, in which the percentage of lead in sulphate of lead is given as 68.28 instead of 68.32. These seeming errors are not corrected in the late editions. They are not, however, of great importance in practice here.

MR. CLIFF has resigned as Superintendent of the Empire mine, Plymouth, Amador county, and Robert Robinson, formerly of the Oneida, has taken his place.

The Sweepstake Iron Wagon.

We give on this page an engraving showing the trim and symmetrical appearance of the sweepstake iron wagon. This is a California invention, and has achieved a good name all over the State. In our dry climate, during the long summers, wooden wagons often "come to grief." This wagaon ought to be specially useful in the arid regions of Arizona and New Mexico during the hot seasons. The wagon is a most important mechanical aid to industry. Upon another page of this week's PRESS may be found a detailed description of the design and construction of the important parts and the general value of the whole vehicle, to which the reader is referred.



SWEEPSTAKE IRON WAGON WITH RACK-BED.

The Railroad Bridge at Yuma.

The engraving on this page shows the Southern Pacific railroad bridge at Yuma, where the road crosses from California into Arizona. A description of the route to this point and of the crossing itself will be found in the letter of our special correspondent on the second page of this number of the PRESS.

Published by permission of E. Conklin, Author of "Picturesque Arizona," etc.]

SOUTHERN PACIFIC RAILROAD BRIDGE AT YUMA.

PROGRESS OF SCIENCE.—Prof. Clark Maxwell looks for the day when physicians in London will examine their patients by auscultation in any part of the Kingdom, and when the Entomological Society, putting a microphone in a nest of scorpions under the tropics, will be able to compare their music in rooms of the society with that of the nightingale or that of the cat, and thus increase the interest which has been awakened by Wood Mason's discovery of a musical apparatus in those venomous insects.

A LARGE share of the ore and base bullion output of the Wood River region finds its way to Salt Lake for reduction and refining. It is hauled cheaply as back-freight.

WOOD RIVER miners continue to arrive in Salt Lake in squads, and will remain there till spring. All bring good reports of the country and its mines.

Metallurgical Centers.

In previous numbers the MINING AND SCIENTIFIC PRESS has advocated the establishment of metallurgical centers where ores which we term rebellious could be worked in quantity with the advantage of being able to mix them with freer ores. Of course in such cases it would be necessary to have managers with special knowledge and of great experience in the treatment of ores, and everything would have to be on a large scale.

Older countries have these facilities, and, now that our means of transportation are rapidly increasing, there is no reason why we should not also have them here. It only needs men of capital to take hold of it to assist very greatly in the development of our mining resources and at the same time to make money for themselves.

In Australia efforts are now being made for the formation of such centers. A Board appointed in Victoria, N. S. W., to report on the methods of treating pyrites, and pyritous vein stuffs, in discussing the subject, say in their report: "We are fully of the opinion that the establishment of large central works for the treatment of pyrite on the most thorough and approved system would be a very great advantage in every respect. Such works would give rise to many new industries, besides tending to the production of large quantities of gold. It would be necessary to establish works on situations easily accessible to railway communications from the Gold Fields, where the supply of raw pyrites could be regularly and easily obtained. There would be no objection to the occupation by such establishments of advantageous sites on the ground of injury to public health, as the fumes given off in the process of roasting pyrites would be condensed for the purpose of securing the sulphur and arsenic." We said that more than 72,000 tons of pyrites and pyritous ores are treated in Victoria every year, and the Board says "tens of thousands of pounds are annually lost to the Colony by the non-existence of such establishments as are advocated."

The conditions here are the same, and the necessities the same. With a sure market for certain classes of ores here, many mines would be worked on this coast which are now idle. Men who cannot afford to run metallurgical works in connection with their mines, would work the mines if their ore could be sold, or could be sent to reliable works for beneficiation.

A NEW PACKING COMPOUND.—A compound of India rubber and asbestos, which is to some extent a new combination, is now used as a packing for valves, its peculiar properties rendering it particularly fit for this purpose. For range valves or high-pressure hot water cocks, it appears invaluable. As it contains no wire, it can be cut to any required size, and will stand any temperature; at present it is used most for packing steam joints and large valves.

THE consolidation of the iron manufacturing companies under the title of the St. Lewis Steel and Iron Company is almost perfected. The total capital stock is $50,000,000.

THE Southern Eureka mine, Plumas county, has been listed on the New York Stock Board.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

AMERICAN
MACHINE AND MODEL WORKS.

All kinds of Light Iron and Wood Work, including Patterns, Gear Cutting, Planing, Engine, Musical Instruments and other repairing. Dies, Taps, Reamers, etc., a specialty.
HEALD & BANKS, Proprietors.

LAND

Good land that will raise a crop every year. Over 12,000 acres for sale in lots to suit. Climate healthy. No drouths, bad floods, nor malaria. Wood and water convenient. U. S. Title, perfect. Send stamp for illustrated circular, to EDWARD FRISBIE, Proprietor of Reading Ranch, Anderson, Shasta County, Cal.

Quartz Crushing Machinery.

A Lecture to Mechanics and Apprentices.

At the meeting on Thursday evening, Mr. John Richards, Superintendent of the San Francisco Tool Works, delivered to the young mechanics and apprentices of this city a lecture on "quartz crushing machinery," of which the following is a report:

The common processes for pulverizing quartz or mineral stone can be divided into four classes or divisions:

First—By *percussion* or blows, including stamps and all similar machinery operating by impact.

Second—By *pressure*, represented by machines having short range and positive movement—Cornish rollers, for example.

Third—*Masceration*, or rubbing action, represented by that class of machines where mullers are employed.

Fourth—*Disintegration*, when the particles or pieces are reduced by attrition, or as we might say, worn away by striking against each other, or against parts of the machine.

The advantages of these different methods are to be judged from two standards—mechanical and economical—not that these two things are essentially different, for in the end they become the same thing, but because in the progress of invention and improvement the mechanical standard seems to be almost alone the only one considered.

In nearly if not all descriptions of quartz crushing machinery you will find explanations of mechanism—the manner of operating; but of the nature of the process, or its "genesis," as we might say, not one word.

Before proceeding to speak of these several processes, and apply to them the test of mechanical and economical principles, I will lay down, as well as I can, some of

The Mechanical Conditions

Under which all quartz or stone crushing machinery must operate.

These conditions, or principles they may be called, are general, or universal we might say—not confined to quartz machinery alone, but applicable to all kinds of machinery.

The first of these conditions to which your attention had been called, is the strains of machine action, whether resisted by moving or fixed surfaces, absorbed by inertia, or resisted by framing. Whatever power is put into a machine must pass out again less what is absorbed by friction. This is inevitable, and you will find in all machines driven by hands or otherwise, a force transmitted to the work, or in some other way absorbed, equal to what is communicated to or put into the machine.

The methods by which this force passes out of a machine, or is applied to work, determines the strains of machine action.

Take the case of a lathe for example. The driving power of the hand passes off mainly at the point of cutting, communicating strains in various directions to the carriage, spindle and framing. A rock-breaking machine is a still plainer example, because the expended force is nearly in one plane. The force of the hand, moving 1,000 ft. in a minute, is communicated by reducing mechanism to the jaws, which may move two ft. in the same time, the proportion being as 500 to 1. The strains in the two cases would be as the speed—that is, the pressure on the jaws would be 500 times as much as on the periphery of the driving pulley.

What I want to particularly point out now is that these

Strains Wherever they Pass off Must be Resisted.

Action and reaction are equal. A force exerted in any direction generates an equal force in an opposite direction, so that in machine action wherever a force passes out of a machine there is an equal force passing back into the machine. Perhaps a simple lever will make this more plain. To use a lever we must have a fulcrum, or as we might say, two fulcrums. The force on the fulcrums and on the work are equal.

This law of machine action you can see proved in every example. Machines that exert great force, such as pinches, rollers, presses and so on, have heavy, massive frames to resist reactive strains. There are, however,

Two Methods of Resisting these Strains.

You are all familiar with stamp mills and the method of their construction. They are a neat kind of machine, not capable of withstanding much strain in any direction. I doubt if the framing or other parts of a common quartz battery would stand a sufficient strain to crush a piece of quartz as large as an egg. A small piece of quartz would answer as a fulcrum for a lever that would pull the parts of a common stamp battery into pieces. Here then seems an anomaly! The best known and most effective quartz-crushing machine, surpassing all others in endurance, yet without strength enough in its framing or parts to crush a pebble of quartz! The force given out must fall equally in reaction on something, that is evident. If the stamps descended slowly and positively as the jaws of a rock-breaker do, we would soon see where this reaction force was expended. One stroke would be enough to lift the framing from the battery.

The Force Expended on the Quartz

Is absorbed by the inertia of the stamp head, stem and dies. The force of the driving hand is communicated by the cam and tappete to the stamp and stem, raising it by a force acting throughout nearly one-half the time. This accumulated force is expended on the quartz in perhaps one-hundredth part of the time, and with an intensity, or measure, corresponding to these relative times of action. The reactive strains of the blows are not communicated to the framing of the machine, only concussion or jar. The driving force that does fall on the framing is communicated from the bearings of the cam shaft. This strain is slow and easily resisted.

This matter of inherent strain in machines and the framing we find resolved into a proposition like this: In all machines acting by impact or blows, the force expended on the work does not react on the framing, but is absorbed by the momentum and inertia of moving parts. Second—That all machines with positive or direct action have to resist in their parts a reactive strain equal to that expended on the work. Here you will perceive a broad distinction between stamps and all machinery having positive movement, rollers or mullers for example. The value of this distinction we will consider further on.

The Second Condition of Machine Action

I will call your attention to, is the maintenance of cutting or abrading edges and surfaces, the point where power is given off, so to speak.

In machines for cutting metal their action is expended at the cutting edges of the tools, and the maintenance of these edges is the most expensive part, except attendance. It includes tools, tool dressing and grinding. In wood cutting the maintenance of edges is also an important part. Whenever a machine deals with material, whether by cutting, crushing, rubbing or otherwise, there is a constant destruction of the implement, he what it is, that stands between the machine and the material acted upon.

In a stamp mill these implements are the shoes and dies. In other quartz crushing machinery they are represented by the surfaces that come in contact with the material. The abrasive wear of metallic surfaces in quartz crushing is a matter you are all familiar with. In any particular method of pulverizing quartz, there is

Worn Away by Abrasion

An amount of iron or steel corresponding with the quantity of stone crushed; the same as there is a nearly regular amount of edge worn away in cutting iron or wood, only much more. This wear is one of the principal items of expense in maintaining quartz crushing machinery; and I incline to the opinion that the wear of such surfaces is in proportion to their rubbing action mainly; that is, the wear of the abrading or acting surfaces is least when they act parallel to each other. I am also of the opinion that the wear of such surfaces, shoes, dies or the jaws of a breaking machine, for example, is not in proportion to the hardness of the material employed, but as its friability. Every mechanic is aware that a hard file can be rapidly ground away on an emery wheel, while a piece of soft iron can not. The surfaces of Cornish rollers, I am informed, wear longest when of wrought iron, and I think in respect to shoes and dies a close hard, but at the same time malleable material will last longer than a hard one, or one that is friable.

What I want to point out in this connection, is that in

Stamps or Percussive Machinery

For ore crushing the wearing surfaces are provided from cheap material, and require but little fitting to prepare them for use. Shoes and dies for stamp mills, with the required preparation, are worth only — cents a pound at this time, while for any machinery operating by positive motion, rollers, mullers and so on, the wearing surfaces would cost much more for renewal. At the late exhibition here there was, for example, a machine where the abrasive or crushing surfaces were of tempered steel or chilled iron—I do not know which; but at any rate would require turning, and would cost perhaps three times as much relatively as shoes and dies for a stamp mill. Not only this, such rollers if of hard material would without doubt wear away much faster than if made of some close malleable material.

In a common stamp battery the crushing faces, so to call them, approach each other parallel; and, aside from the slight rotation given by the cams, there is no rubbing action. Such rubbing action is required in that case to cause a uniform wear upon the die faces, and is perhaps just enough for that purpose; so that in respect to use as well as first cost, we find the percussion or impact principle the most favorable in an economic way.

The third condition of operating, to which I will call your attention, is

Maintenance or Wear,

Including the regular depreciation and accidental breaking of parts. At first thought it would seem that machinery acting by impact or blows would be more liable to accident than that which operates by pressure or rubbing. This would be true of pressure machinery that expends its force on metal as in the case of steam hammers; but it is not true of ore-crushing machinery, when the dies drop on a layer of quartz and pulp that cushion them.

If a battery was so perfectly made that the dies and shoes would fit on their faces, and such a battery was ran without anything in it, then the analogy to metal hammers would hold good—the results too, perhaps; for I imagine the heads would split, the tappets move, and the machine become a wreck in a short time.

Wear in Stamp Mills.

Compared with other ore-crushing machinery, the percussive class is more free from wear and accident. Taking a stamp mill for example, there is no strain to speak of on any moving joint. The principal stress is of course on the cam-shaft bearings, but that is not great, and, as experience proves, these bearings are easily maintained. The other joints, we may call them, where wear can take place, are the stem bearings, and the contact surfaces of cams and tappets. Both these joints or bearings, as well as those of the cam-shaft, are placed far above the stamps where the surfaces can be protected from sand and grit, where they can be oiled or examined without trouble and renewed without much expense.

If you will now consider any

Machine Operating by Pressure,

Masceration or disintegration, you will in most cases find bearing surfaces that have to withstand a pressure equal to that applied to the quartz. I know that in some machines this pressure is balanced by a double action; that is, one surface acting against another, as in the Redstone machines; but in the case of rollers, and indeed in nearly every machine, the stamp mill excepted, you will find bearings in the vicinity of the quartz that have to resist great pressure, and which must be kept close. Such bearings must soon be destroyed, and it requires no wide experience to determine the wearing life of such machinery without seeing it at work.

In all machinery acting positively with great pressure and on hard substances, the breakage, as we call it, is an important item in maintenance. In this class belong rolling mills, bolt and rivet machines, presses, pinches and most kinds of quartz machinery, not included in the impact class.

Facts of Experience.

I will digress here to remark that no doubt most present have thought that the best method of determining these various conditions of machine action would be to observe and collate facts. This seems a most thorough way to reach true conclusions, but it is unfortunately impracticable, and if practicable, could not be applied to hundreds, perhaps thousands, of quartz-crushing machines yet to be invented. The facts of past experience, even if they could be collected and compiled, could only be applied to new inventions by analogy, and to be able to draw such analogy, the present method of investigation is necessary.

In a former lecture I had the honor to deliver here, your attention was called to the value of analytical reasoning, respecting mechanical problems. It is especially important in our present subject, because the process is not a common one, and but little is to be drawn from popular conclusions.

Returning now to the

Cost of Maintenance,

There is one factor in such cost that I may not be able to make so plain as the wear of dies. I mean the interdependence of parts one upon another. This is an element of much importance in many kinds of machinery, as well as that for ore crushing.

Suppose, for example, that a quartz mill of 10 stamps will crush 10 tons of ore in a day, and that one of the steam stamps, such as are made in England, will do the same work, the cost of the machinery and running expense would perhaps be much the same, but there would be this difference: The steam stamp would depend upon each part; a single screw broken would stop the machine; to put in a new die would stop all; the product, too, would have to be the same in order to get a good result from the power expended. Such a machine, if kept operating three-fourths of the time, would do well.

The common stamp mill, on the contrary, would in most respects represent 10 machines, each one almost independent of the rest. It is true the parts would be more in number, but the chances of delay from accident would not be nearly so great as in the case of a single stamp of 10 times the capacity. One battery could be stopped; the other would go on just the same; or anyone of the 10 stamps could be "stopped up" in an instant, and the rest go on.

I could go on with various other conditions of operating, such as feeding and clearing batteries, the uniform resistance to motive power, and so on, but time will not permit. I had also, at the beginning, intended to carry our investigation to machinery acting by pressure, masceration and disintegration, but the rest of the time can, I think, be better spent in some general remarks. What I have thus far said, has been mainly to call attention to a method of investigation. The value of this method you can yourselves determine by applying it to the history of ore-crushing machinery in this and other countries.

For centuries past,

The Stamp Mill,

Or other machinery with percussive action, has held its place as the best and most economical. Mineral stone, or quartz at least, is a hard material of crystalline structure. Stone that has been melted, and is homogeneous, a blow rapidly given will cause more fracture than the same force applied as pressure or in rubbing. The first ore reduced was, no doubt, pounded fine with hammers; so was the last crushed to-day, and so will the process be carried on in the future.

There have been in California many inventions in ore crushing; most of them relating to stamps have been of value, and mark an advance, but there have also been many inventions, some of them costing large sums of money, that were founded on principles at variance with the operating conditions pointed out this evening. The premises have been wrong; the starting point, instead of being an effort to supply some wanting element in the process, has generally been some new mechanism that supposedly would give results better than a stamp battery.

I venture the opinion that in a process so simple and backed up by a long train of experience,

There Should be no Mistakes

Made as to the value of new ore crushing machines, not in so far as pulverizing at least.

I do not, however, claim that the several propositions laid down this evening cover the whole ground—far from it. Yet the methods pointed out, if fully and completely applied, will, I believe, determine the true merits of new inventions without the expense and labor of constructing machines for experiment.

A little more than a year ago I was consulted as to a proposed new method of crushing quartz. The subject was new to me and I may add fortunately so, because I began at the beginning and proceeded inductively, so to speak, but for all that, came near running into a great error.

The Proposition was to Employ Rollers.

Not the common Cornish arrangement, but one more elaborate and involving details which need not be described now. As is always my custom in such matters, the first thing was to examine the history of the art, and observe its tendencies. I found in California that reciprocating breakers were employed instead of rollers. I knew also that since the introduction of these machines in Europe the rollers had given away to them. Stone crushing at the mines and for streets was done by reciprocating machines—yet it was difficult to see why a large roller revolving continuously would not far exceed the performance of a reciprocating machine with one-tenth of the surface and still less speed. The problem was a quandry in my mind for a month, when it was cleared up in a few minutes by a proposition mentioned, I think, previously this evening, namely, the capacity of a machine for crushing is as the parallel approach of the acting surfaces or their angular velocity. I had been counting the circumferential velocity of rollers, not the angular velocity of their periphery, and to my astonishment, I found the rock-breaker outrun the revolving roller.

Measured by this standard all became plain, the supersedence of Cornish rollers was no longer a mystery but a natural sequence of improved mechanism and method. [Illustrated on the blackboard.] This I relate to show how certainly one can reach correct conclusions without experiment if the true premises are gained and deductions made accordingly.

The methods I have described are those of the consulting engineers, a profession almost unknown in our country.

Investments are Made here in new Inventions and Schemes

Without such precautions as are employed in older countries. In matters of law or indeed in nearly all cases except engineering or manufactures, the counsel of skilled persons is called in, but in new mechanical expedients, the Keeley motor for example, the shareholders do not think it worth while to consult a scientific man or competent engineer. Suppose two men were to start out to-morrow to search for capital to be employed in two undertakings; one to develop some new motive power on principles that controverted all the established laws of dynamic science; the other to establish the manufacture of horse shoes and hoes, which do you think would succeed best? The tendency is to the marvellous; the popular conception of invention is that it is chance and accident. Let me assure you this is not so, and that inventions and true progress can become a matter of principles and demonstrative science. Since I have lived in San Francisco I have seen thousands of dollars expended on machinery that controverted several of the very plain operative conditions before named. Everyone, almost, thinks himself competent to pass opinions upon quartz crushing machinery, mechanics and miners perhaps least of all.

In all such cases where one meets an inventor of quartz crushing machinery, the first question should be what particular part of the present method is at fault, and how is your machine to remedy this? Second, is it certain the new machine embodies all the functions and advantages of those now in use. There has been

An Age of Chance

In these things—a time when a tailor, a shoemaker, or politician might invent mechanical processes and machines, but that time is almost gone. It was the dark age, so to speak, of invention and of dynamic science. A little of this kind of invention remains—discovery we should call it. In chemistry, for example, and in electricity and magnetism, where intangible gases are dealt with. I firmly believe in respect to ore crushing machinery that there is in this city enough and more than enough knowledge of the process to enable a complete judgment to be formed of any new machinery for the purpose without experiment.

I know too that there are not many who will concede this, and that it is almost a heresy to make such a proposition, but I ask especially of the younger mechanics here to-night, to remem-

ber tbis and see if tbe future will not prove tbe assnmption.

For 30 years it bas been my fortune to be in some way identified with the construction of mechinery, tbe most of it novel, or at least varying from the heaten path; and every year as experience goes on tbe more I see proves that in the future, and not distant, nearly all processes in converting common materials snch as wood, stone, metals and so on, will be determined without experiment.

As remarked in a previous lecture, I ventured such an opinion ten years ago respecting metal-working tools, thatis tools forcold processes, sucb as turning, planing, drilling, milling, and so on. Tbe idea met with some criticism, not to say derision, especially among the chance schemers, bnt it has been steadily gaining ground, especially in continental Europe, and more especially in Germany, where tbe science, so to call it, of mecheuical analysis has a fast hold. In our own country the great advances made in mechanical art has been mainly

Due to Quick Perception,

Rather than methodical deduction. Tbe experimentel method is safest and surest up to a certain point, when the margin of improvement becomes narrow, tben tbe inductive method must prevail.

We are tending that way but not so fast as we might. With fifty millions of population we have fewer technological schools than Sweden with a populatiou of four millions. Northern European countries, including even Rnssia, which the Englisb tell us is uncivilized, are in advance of this country and England in the matter of technological schools.

The effect of their system is being felt all over tbe world, and we csnnot much longer ignore its importance. Our wonderful skill in making things is more than balanced by our competitors understanding them better. They will learn to make our products in time and unless we employ their means may excell us.

To illustrate tbis let me ask bow long the Keeley motor humbug would have lested in Northern Europe, Germany, or Sweden, for example. I do not think thie ebameful humbug could bave existed there eigbt weeks, much less eight years. We bave here all the elements of a rapid and wonderful progress in mechanical art, except the analytical metbods of investigation, and if I have succeeded in causing some interest in its applicatiou to orecrnshing the objeot of this evening's lecture hes been attaiued.

A Debris Compromise.

A Proposed Plan for Overcoming the Difficulties.

EDS. PRESS :—The recent visit of the committee of merchants to tbe region most effected by the "slickens" question bas rcsulted in great good, by paving the way for an amicable adjustment of the difficulty between tbe farmere and the miners, without stopping the great industry of hydraulic mining or causing further injury to tbe farming interest. The opinion of Gen. Rosencrans, one of the committee, that to stop bydraulic mining by legal process will not seve the farmers, on account of the immense quantity of debris already accumulated in tbe river chaunels whicb must inevitably come down with the winter floods and bury the lands below if not checked or coutrolled in some way, is strictly correct, and brings into prominence the leading fact on which must be based a compromise of the conflicting interests. The proposition of Mr. Hamiltou Smitb, Superintendent of one of the leading hydraulic mines, to impound all futnre debris from the mines on the Yuba river, by conetrncting an immense stone dam in a deep gorge at a suitable poiut, which will catch and hold back in the mountains all debris that will ever be discharged into tbat stream by the future working of these mines, is entirely feasible and cleerly indicates the proper remedy to be adopted. The failure of the brush dam erected at the expense of the psople of tbe State resulted from ite being built in the plains insteed of tbe mountains. Had the money been expended in building tbe stone dam proposed by Mr. Smith on the Yuba and a similar one on Bear river in tbe mountains eomewhere, tbey would have proven effective and permanent in character.

But, to build such dams and to protect tbe valley lands from the debrie already accnmnlated below the points where the dams may be located, will require a large eum of money, to be furnished by private individuals, and expended under a uniform eyetem or plan of operations whicb shall apply to all mining streams alike. We say it must be done by private enterprise, because it must be accomplished speedily and economically; neither of which objects can be secured by public appropriatione. All euch enterprises undertaken by tbe Government degenerate into political jobe and gigantic ewindles extending over as long a period as possible. Our recent experience in "slickens" legislation and brush dam building ought to eatisfy ue on that point. To enlist private capital in any enterprise it must he shown to he not only practicable but profitable as an investment. Tbie we will endeavor to ehow briefly without entering into details at the present time.

Proposed Re-working of River Beds.

Having carefully examined into the topographical features and tbe economic value of the channel of Bsar river and its immense deposit of hydraulic tailings, togetber with the original unworked bed and banks buried under tbem, with a view to the re-working of tbe same, tbe writer of tbis (an argonaut and practical miner) became convinced tbat many millions of dollars lie in tbat channel, a sure reward to the parties who shall re-work its contents for a distance of 20 miles or more below the bydraulic mines tbat discharge their tailings into it. Anyone cen satisfy bimself of the correctness of this opinion by visiting the locality and learning from the old settlers the history of mining operations on that river and its branches from "the days of 49" to the present time. They will tell you that the original river bed was never worked by Chinamen, having tbemselves been driven out hy tbe rapidly accnmulating deposit of tailings, while they were making large wages with the sluice or rocker in the rude end wasteful manner of saving gold of those early days. They will tell you that the tailings from tbe early workings of the hydraulic minee were far richer than those of tbe present time, with paved flnmes, nndercurrents, etc., whicb are now employed to largely increase the percentage of gold saved in washing. They will also tell you, and yon can see for yourself, that nndercurrents have been put in at varions pointe many miles below the mines, over which pass the fine sand and gravel flowing with the current at all times, leaving enough gold and amalgam to pay well for the labor and money expended, though catching but a moiety even of what is brought down to them from above. There are also hundreds of tons of quioksilver deposited in the channel with the tailings, whioh would be recovered by re-working.

It ie claimed and believed by many tbat tbe sulphurets and black sand, when concentrated from the tailings, are valuable for the gold tbey contain, independent of the free gold and amalgam with which they are associated. The same condition of tbings exists upon the Yuba, Feather and American rivers, and all others which serve as outlets to the hydraulic mines. They all contain sufficient gold to abundantly reward those who will re-work them; and tbe plan of operations proposed for Bsar river will apply to each of the others.

A Sketch of a System of Operation.

Any system of operation that may be adopted must not only remove the deposit of tailings already accnmnlated in tbe channels of the rivers as well as those to be deposited hereafter, but must make such disposition of tbem as will insure the country below againet injury from the debris set in motion by tbese operations; for the waters of these rivere must continue to flow to the sea, in the future as in the past. That such a system is practicable and may be operated with the means and skill of private individuals, associated together as in other large mining enterprises, we will endeaver to ebow.

All these streams have a heavy fall or grade in the mountain region, tberefore dams may be constructed at almost any given point—not hundreds of feet in hight to bold back the debris, as Mr. Hamilton Smitb proposes, but 10, 20 or 30 ft. only—to give a sterting point for the head of a flume into wbich the tailings may be directed with the aid of tbe stream flowing naturally down the channel of the river. Build the flume with a pertition, dividing it lengthwise, making a double flume in fact, one-half for summer and the whole for winter nse. Carry tbis flume along tbe bank of the river down to some large ravine pntting in, and extend it along tbe bank of the ravine to its head, or near it, into wbich the debris is to be discharged until it wi l serve for tbat purpose no longer, after which the flume may be extended across to tbe opposite bank, and continued along to its junction with the river, and along down the bank of the latter until tbe next ravine is encountered, which being filled like the first, the flume is again extended in like manner to the third and so on to the end. If there is grade sufficient, and otber facilities, tbe arrangements for saving the gold otber than tbe paving of the bottom of the flume, which begins with the flume itself, may be introduced before reaching the first ravine, and the water and finer portion of debris, not tbrown out by the grizzly, taken up egain and carried onward in the flume to the ravine. It will generally be most convenient, however, to put up the gold-saving apparatus in the ravine, as it would otherwise give too little room for tailings, and too short a distance of paved flnme; for of couree, no paving or other gold-eaving appliaucee wonld be required after passing beyond the first plant of grizzlies and undercurrents, or such other macbinery ae may he adopted. It is expected that in taking np the tailings in a flume eo far below the mines no large bowlders will be eent into the flnme, they being lodged bigher up the stream. Below the gold-saving station a emaller flume will be required than above, thereby diminiehing tbe cost of construction. The coaree gravel will be screened out and left at the first or gold-eaving station, consequently ample room must be reeerved for the purpoee.

Disposition of the Debris.

In working out the bed of tbe river and the depoeit of tailinge above the dam, it will be neceeeary to extend the flume np etream as the work progresees. This will be accomplished hy working a eection of 1,000 or 2,000 ft. of the cbannel at a time, by erecting a temporary dam tbat distance above the first, so ae to run the water and material above tbe new dam, in a direct course down to tbe flume, over what may bs supposed to be the lowest portion of the bedrock, on wbich the flume is to rest wben extended. Tbe contents of this eection between the two dams, is then conveyed into the flume. If it is possible to have the aid of a small stream under ligbt pressure, with bose and nozzle, it will he a great advantage in wasbing the tailinge and light materiel at tbe sides towards the etream leading from the upper to tbe lower dam and tbence into the flume. If this is lacking then laborers will have to be set to work with wbeelbarrowe, and side or branch sluices leading to the flume. A line having been tbns opened down to the bedrock between the dams the flume ie to be extended up to tbe temporary dam with which it mnst be connected and the stream turned into it, wben the remainder of the unworked material in the section is run into the flume by the aid of sluices, wheelbarrows and derricks if necessary. In these operations tbe bonlders, logs, etc., are left in the channel after working, so piled against the sides as not afterwards to binder tbe flow of tbe current in the season of bigh water. Of course, there will be many obstacles encountered in managing the stream between tbe dams, especially while engaged in extending the flume up stream, but all can be overcome by skillful management by men capable of conduoting heavy placer mining operations. During tbe period subject to great fresbete tbis work would have to be suspended, and dams, flumes, etc., made secure against injury by high water. Provision must he mede of course, for the passage of tbe surplus water over the dam and along tbe natural cbannel of the river below, witbout destroying either tbe dam or the flume, eveu though a temporary additional flume were required along eide of tbe permanent one a portion of the distance, for such emergencies.

How to Handle the Debris below the Dam.

When the flow of debris to the valley is thus stopped the current will rapidly cut down tbrongh the accumnlated deposits in tbe cbannels leading through the valley, carrying them off to tbe sea. In otber words, the debris now complained of, occupying the cbannels of the Feather, Yuba, Bear and American rivers, will be sluiced out and carried to the sea very quickly unlese diverted by human aid to tbe tule lands for the pnrpose of reclaiming tbem. This should be done and may be easily accomplished by private enterprise, as a promising investment. If the farmers and miners do not choose to unite for the accomplishment of tbe project of the clearing of the whole length of the rivers, let the miners assume the expense and risk of tbe mining operations, and the disposition of the debris of the npper or mountainous portions, and tbe farmere assume the control of the lower or valley portions of these rivers. Let the State grant its tule lands to the corporation formed by the farmers for the purpose, and the individuale owning any lands to be reclaimed enter iuto contract to pay a etipulated price per acre for filling them in to a snfficient deptb. Tbese lands, now wortbless, will, wben filled in witb the finer portion of the debris, namely, tbe sand and "slickens" proper, be worth $100 or more per acre. The proceeds of thoir sale after reclamation, and tbe enhanced valne of the now submerged and threatened lands, will return to the stockholders their outlay and interest, to say nothing of the value of the river bed and banks in the upper or foothill portion of their district for mining purposes, after the removal of the debris therefrom.

To control the debris and reclaim tbe tule and overflowed lands, a dam will have to be built on each river at tbe proper point in the plains above the lands to be filled in, of only a few ft. in hight, just sufficient to give a etarting point for the head of a flume to convey the material to the lowlands, which will be brought down by the etream as it cuts its way down through the debrie accumulated above. This flnme will bave to be a wide one, divided by partitions lengtbwise into several channels, so as to use one or more, or all of them at a time, as the quantity of water and debris flowing through may require. In times of great floods, which no human power can control, tbese flumes and dams might be swept away; but as they are comparatively inexpensive, the loss once in five or ten yeare will not be serions. The flow of debris may be controlled in a flume, on a ligbter grade tban that of the natural cbannel, as is well known; consequently, several feet full may be secured in running the flnme to the dumping places in the lowlande, whence branchee may be extended for distribution over large areas.

There are many details connected with tbe scheme herein proposed, which will enggest themeelves to practical minde without calling attention to them in thie article. That the echeme is entirely feaeible the writer fully believes, and he bas endeavored to make it appear so to otbers. It ie confidently enbmitted ae a practical eolntion of the debris problem.

M. T.

TESTING WATER FOR IRON.—To ascertain if water containe iron, take a glass of water and add to it a few drope of the infueion of nutgalle, or euspend a nutgall in it by means of a thread, for 24 houre. If iron be present, the water will become of a dark brown or black color. Prnsciate of potash is a still more delicate teet for detecting iron. If a crystal, or a drop of it, wben dissolved, be added to a glaes of water containing iron, it will immediately become of a blue color.

Wages and Cost of Living in Arizona

From the pamphlet recently issued by authority of tbe Legislature, on tbe resources of Arizona, we take the following paragraphe on this important subject:

People who are looking for homes in a new country, naturally feel an interest in tbe region to wbich they think of emigrating, and more particularly in whet they can earn, and how much it costs to live.

Miners are paid four dollars per day tbrough-out the Territory. This ie tbe rate of wages for underground work which has prevailed in Nevada, and whicb hes bsen estabiiehed in Arizona.

In some small and isolated oampe, a lower rate has been obtained, but good workmen, who understand their calling, cannot be hired for less tban tbe prevailing rates.

Blacksmiths receive from $4 to $6 per day, first-class workmen getting the latter price; carpenters get from $4 to $5 per day; bricklayers and masons, $5 to $6 per day; engineers, $5 to $6 per day; printers, $4 to $5 per day; clerks, from $50 to $100 per month and board; teamsters, from $40 to $70 per month and board; herders, from $30 to $40 per month with board; farm laborers, from $30 to $40 per. montb, and day laborers, from $2 50 to $3 50 per day.

Tbe supply of labor ie generally in excess of the demand. Like all miuing countries wbich have recsived a sudden impetus from the opening of railroads, Arizona has drawn within ite bordere a numbsr of people who have found themselves, on their arrival in the country, destitute of means. While there is alwaye a cbance for men of energy and induetry to make their way, it is not advisable for mecbanics and laboring men, who have no means, to rush to Arizone. While tbose who are employed ohtain good wages; it mnst be borne in mind tbat tbie is a country whose many resources are just beginning to be developed and that the demand for labor is limited. To men who bave some means; who are in a position to take advantage of the many profitehle openings tbat preeent themselves; who may be in possession of a small capital to begin the battle of life; wbo have the wherewithal to try their fortune in seeking for the treasures tbat lie hidden in our monntain fastnesses, Arizona offers advantages not equalled by any State or Territory in the Union. But of the workingman, who has only meane sufficient to bring him to the country, and is dependent solely on his daily labor, Arizona has already enough, and it is not tbe desire or intention of this publication to bold out uncertain inducements to that class of emigrants.

The cost of living in the Territory is not more expensive than could be expected in a country, the greater portion of whose eupplies are brought from euch a distance. With tbe exception of eome grain, flour, hay and vegetables, everything worn or consumed by the people of Arizona is shipped from California or tbe East. In Tucson board can be had at from $6 to $8 per week, and at the leading botels at from $1 to $2.50 per day. In Tombstone, board is from $8 to $10 per week, and in the different mining camps througbout the southern portion of the Territory, the seme rates prevail. Rents in Tucson and Tombstone are not high, considering the rush of emigration to those towns, and the remarkable advance in real estate. A comfortable residence of three or four rooms, in a suitable location, can be bad in Tucson at from $20 to $30 per month. The ratee are about tbe same in Tombstone. Clothing, boots and sboss, dry goods, groceries, and everytbing necessary for housekeeping, are eold at fair prices. A suit of clothing can be bought at from $15 to $30; a pair of boots at from $4 to $8, and all other articles in a like proportion. Of groceries, sugar is 20 cents per pound; coffee, 25 cents; flour, $5 per cwt.; beef, 8 to 12 cents per pound; and vegetables and all other articles of food at similar rates. In Phœnix, the agricultural center of the Territory, prices of clothing and groceries are about the same as in Tucson and Tombstone, while grain, flour, vegetables and fruits, are mnch cheaper.

In Prescott and throughout northern Arizona the ratee of wages do not differ materially from those which exist in the southern country. Board in Prescott is from $8 to $10 per week. Groceries, clothing and provisions are a trifle higher tban in Tucson and Tombstone, owing to the greater distance from the Southern Pacific railroad, and the increased cbargee on freight. The opening of the Atlantic & Pacific will give northern Arizona a direct line to tbe markets of the Eaet, and eupplies and material can be laid down at Prescott and tbe northern mining camps, at much lower ratee than at present.

From tbis brief eummary it will be seen tbat tbe coet of living in Arizona, taking into coneideration tbe long dietance from the eourcee of enpply, cannot be considered high; and although theee figuree may appear rather large to people accustomed to those prevailiug toward the rising enn, it must be borne in mind that every branch of labor and every profeseion or calling receivee a great and generoue remuneration for ite servicee in this prosperoue and progressive Territory of tbe Southwest.

THE Summer mine of Kernville is now running 60 etampe. But 20 etamps have been ueed the past year. It givee briekness to business of all kinds in tbat mountain district.

PACIFIC IRON WORKS

1850. 1881.

Rankin, Brayton & Co.,

127 FIRST ST., SAN FRANCISCO,

BUILDERS OF

MINING MACHINERY.

Plants for Gold and Silver Mills, embracing the lateet and most Improved Machinery and processes for base and free oree. Water Jacket Smelting Furnaces for silver, lead and copper ores, with new and important improvemente euperior to any other make.

HOISTING WORKS,

Pumping Machinery,

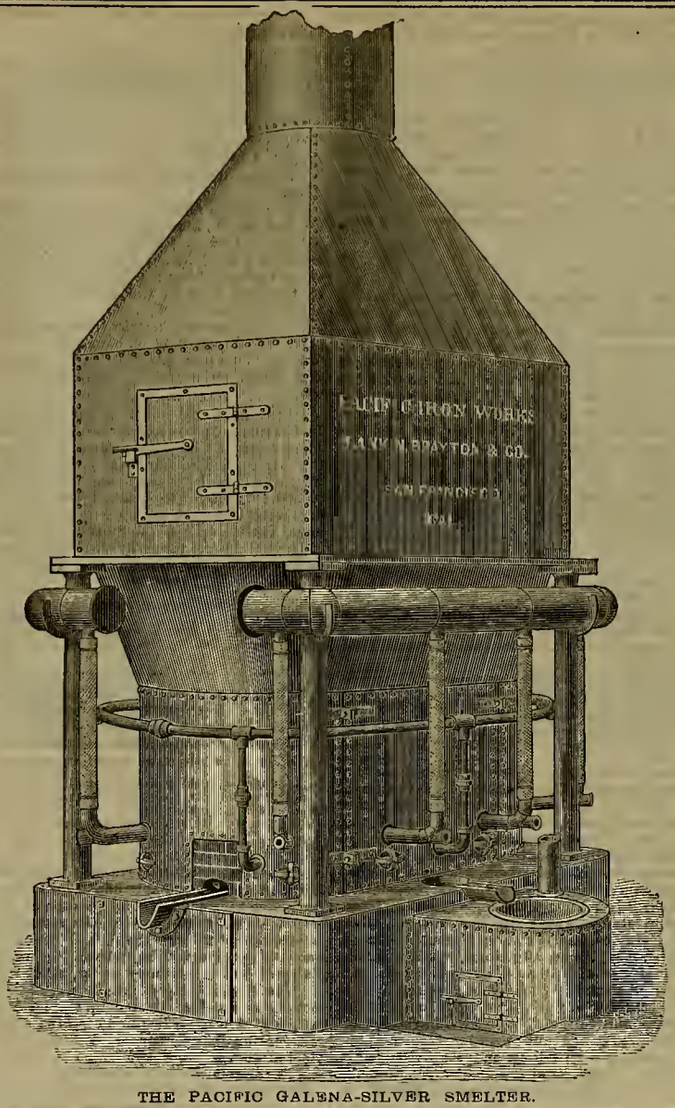
Chloridizing Furnaces, Etc.

We offer our onetomers the best results of 30 years' experience in thie special line of work, and are prepared to furnish the most approved character of

Mining and Reduction Machinery,

Snperior in design and construction to that of any other make, at the lowest possible prices. We also contract to deliver in complete running order, mille, furnaces, hoieting works, etc., in any of the States and Territories of the Pacific Coast. Estimates given on aj p'icati n.

SEND FOR ILLUSTRATED CIRCULAR.



THE PACIFIC GALENA-SILVER SMELTER.

WATER JACKET SMELTING FURNACES

For Galena, Silver and Copper Ores.

THE PACIFIC WATER JACKET SMELTERS embrece many features that are entirely new and of great practical utility, which are covered by lettere patent.

No other furnaces can compare with these for durability, and in capacity for continuous and uninterrupted work.

MORE THAN FIFTY

Of them are now running on the Pacific coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced.

These smelters are shipped in a complete state, requiring

No Brick or Stone Work,

Thus saving great expense and loss of time in construction.

COMPLETE SMELTING PLANTS

Made to order with all the improvements that experience has proved valuable in this class of machinery. Skilled and experienced smeltere furnished when desired to examine mines and to superintend construction and running of furnace. Send for circular. Estimates given upon appl'cation.

RANKIN, BRAYTON & CO.,

Pacific Iron Works

SAN FRANCISCO, CAL.

A NEW RAILROAD.

Carson and Colorado Railroad,

Nevada.

NOW IN OPERATION TO HAWTHORNE

110 MILES SOUTH OF CARSON, NEV.

The direct, shortest and cheapest route for freight and passengers to the following mining towns and camps: Aurora, Bodie, Bridgeport, Belleville, Candelaria, Columbus, Benton, Montezuma, Silver Peak, Alida Valley, Bishop Creek and Gold Mountain.

C. and C. R. R. trains make close connection at Mound House Station with trains of Virginia and Truckee Railroad, making close connection at Reno with East and West bound trains of the C. P. R. R.

Passengers leaving San Francisco and Sacramento on C P. Overland train arrive at Hawthorne and connect with U. S. Stage Company's line of Concord coaches at 2:45 P. M. of the following day, arriving at Bodie same evening.

Wells, Fargo & Co.'s line of Fast Freight Wagons leave Hawthorne daily, delivering fast freight in Bodie within 36 hours from San Francisco.

To insure dispatch by team transportation from Hawthorne, shippers are requested to mark freight Care D. W. Earle & Co., Forwarders, Hawthorne, Nev

General Office, Carson, Nev.

H. M. YERINGTON, Gen'l Supt. D. A. BENDER, Gen'l Freight & Pass. Agent.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition, 1880), and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. A valuable and carefully written work. Postpaid, $3. Sold by Dewey & Co., S. F

PHILLIP'S EXPLORERS' AND ASSAYERS' COMPANION (Third Edition) Price of Vol 1, post-paid, $6 Sold by Dewey & Co., S. F

COPP'S HANDBOOK OF U. S. MINING LAWS (Eighth edition, 1881).—Pocket size, and very handy for miners. Post-paid, $1. Sold by Dewey & Co., S. F.

CHURCH'S "COMSTOCK LODE, ITS FORMATION AND HISTORY."—Illustrated with diagrams and colored charts showing sections, ore bodies, etc. Post-paid, $7.50. Sold by Dewey & Co., S. F.

U. S. MINING LAWS AND COAL LAND LAWS.—Containing instructions and blank forms. Postpaid, 50 cents. Sold by Dewey & Co., S. F.

MINING, ENGINEERING, MECHANICAL, FARMING, SCIENTIFIC, INDUSTRIAL AND NEW BOOKS in general can be ordered through Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, S. F., at publishers rates.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia, and 59 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorety, 527 Commercial St., S. F.

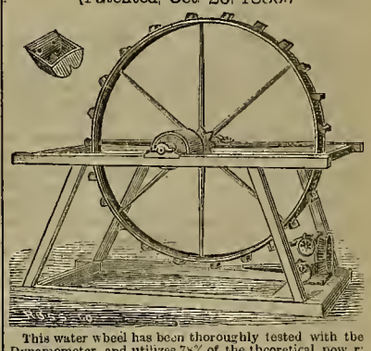
WATER WHEEL.

(Patented, Oct. 26, 1880.)



This water wheel has been thoroughly tested with the Dynamometer, and utilizes 75% of the theoretical power; and underheads of water of 75 to 800 ft is guaranteed to give better satisfaction than any Turbine or other wheel ever offered to the public. The above per cent. is due to the peculiar shape of the buckets used. They do not reduce the water to a spray, but divide and deflect it outward and backward, in such a manner that a part of the impact and the whole reactionary force are utilized, without any part of the water coming in contact with the bucket following. Furthermore, the per cent. of efficiency remains constant through great variations in the amount of water used. These buckets can be taken off in transportation, and can be replaced by new ones when worn out by sand in the water; also can be applied to wooden wheels when desired.

Bullion Production of Arizona.

The mining progress of the Territory of Arizona for the fiscal year ended June 30, 1880, and for the six months of the fiscal year 1880–81 has been most remarkable. The inaccessibility of this region has heretofore been its most prominent drawback. The concentration of capital on the Pacific coast, so far as mining operations or mining stock speculations were concerned, almost entirely upon the mines of the Comstock lode, has also had very much to do with retarding its development. Indian disturbances, especially those connected with the subjugation of the Apaches, tended, of course, to the same end. All these conditions have in the last 18 months named greatly changed or passed entirely away. The cessation of profitable workings on the Comstock (as a basis at least for the concentration of nearly all the speculative capital of the Pacific section) has caused a great diversion both of labor and enterprise seeking occupation and opportunity, and of money seeking profitable investment. The Territory of Arizona itself, in its southern half at least, is traversed by a railroad constructed within the calendar year 1880. The Southern Pacific railroad is now operated from Yuma, on the Rio Colorado, at the western line, to the eastern one near the United States post, Fort Bowie, in Arizona, and the town of Ralston, in New Mexico, a distance of 339 miles within Arizona, of which 325 miles were constructed between February, 1880, and January 1, 1881. This road has opened the river mining districts, made directly accessible those of Pinal and Maricopa counties, and developed, as to travel and transportation, the whole of southeastern Arizona. The region has also been made accessible from the east by way of the railroad system of southwest Kansas, Colorado and New Mexico. The New Mexican portion of the Atchison, Topeka and Santa Fe system of roads was operated to within less than 100 miles, on January 1, 1881, of the point of junction with the Southern Pacific.

The Apache disorders have for four years past been only sporadic in character and have not greatly hindered prospecting and development within Arizona, though the Victorio raids of 1880 have impeded Eastern travel to the Territory in some degree. The largest factor in Arizona development, apart from the direct discoveries of mineral made, always the foremost one, has been in reality the activity of Eastern capital and the national interest aroused in mining investments, discoveries and developments during the past two years.

Arizona is divided into six counties: Apache in the northeast, Maricopa in the center, Mohave in the northwest, Pima in the southeast, Pinal in the center, Yavapai in the north and center and Yuma in the southwest. Apache county has but little special and present mining interest. Clifton, the seat of the Longfellow copper mines, and some placer ground in the valley of the Rio Francisco, are all that is now known.

Mohave County.

Mohave county is the seat of the oldest American mining in the Territory. Some California prospectors were operating there during 1854, and some work has continued down to the present day. The principal Mohave mines are located in the Cerbat district, Mineral Park, near Signal, and in the Hualapai mountains. The McCracken and Signal mines are those that are best known. It is difficult to get a full exhibit of the product of this region, as a considerable amount of work is done under the leasing system and the tributaries carry their small (individually speaking) product to Prescott, Ehrenberg and Yuma, so that, when dispositions of, its figures in other returns. For the fiscal year 1880 the production of Mohave county, as reported, was, gold, $17,350; silver, $178,329. For the six months ended December 31, 1880, an estimate based upon the Territorial newspaper reports will be moderate if put at $120,000, and for the calendar year the total may be stated at, in gold, $20,000; silver, $210 000. The larger portion of this product comes from the Signal mill, and one run intermittently on McCracken ore. The Mineral Park mill has also run part of the time.

Maricopa County.

Maricopa county has an increasing product to show. Its mines, with the exception of the famous Vulture (gold) and the Tiger (silver), are small at present. The Vulture mill now employs 80 stamps, and its product will be large in the near future. The product for the fiscal year 1879–80 was as follows: Gold, $90,072; silver, $238,119; total, $328,191. The product of the Tiger mine is stated at but $17,000, which can be only partial in character. The product for the calendar year may be estimated at, gold, $120,000; silver, $280,000; a total of $400,000

Pinal County.

Pinal county contains within its borders the famous Silver King mine, located in the Pioneer district, with several other mines developing about it, and the Globe district, which produces largely in gold and silver, with the Richmond Basin and the Mineral Creek districts, also largely productive.

For the calendar year 1880, the annual report of the Silver King Co. shows the following: Gross receipts from sales of ore and bullion, $505,641.91.

The *Mining Record*, of New York, gives the following items of production for the calendar year 1880 from the mines named, to wit:

Silver Nugget, Globe district (silver)	$19,272
Stonewall Jackson, Globe district (silver)	28 500
Mack Morris, Globe district (silver)	101 966
Golden Eagle, Globe district (gold)	80,000
Total of definite amounts from mines named	$229,738

The Arizona *Star* of January 1, 1881, gathering its data from the railroad freight returns of Pinal county bullion shipments being made at Casa Grande station, Southern Pacific railroad, gives the following, which include all shipments for the calendar year from the Silver King mine and the mines of Globe:

Concentrations, silver	940,000 lbs.
Silver ore (high grade)	140 tons
Silver bullion	14 tons

The *Star* estimates the concentration as worth over $3 75 per pound. This is manifestly an exaggeration, as the Silver King is the only mine concentrating ore and shipping to San Francisco. At one time the concentration were valued at $1 per pound, and later at but 33 cents. The 14 tons of bullion would be worth $448,000, and the 140 tons of ore would be fairly estimated at $150 per ton net (the grade being often quite high), a total of $21,000. Counting the concentration at 50 cents per pound, or $470,000, the total value of bullion and ore shipped to San Francisco from Pinal county would be:

Bullion (silver)	$448,000
Concentrations	470,000
Ore	21,000
Total	$939,000

And the ore embraced in the above, and excluding the concentration as being in the Silver King's report, and we have for Pinal county the following production in the calendar year 1880:

Silver King, per company's report	$505,642
Silver bullion, per railroad freight returns	448 000
Silver ore, per railroad freight returns	21,000
Miscellaneous mines (various sources)	149,738
Golden Eagle mill (gold)	80,000
Other sources, estimated (gold and silver)	200,000
Total	$1,404,380

The Globe City *Chronicle* publishes the following about the Globe district: "There are over 20 organized companies in the district, and of these the following have mills: McMorris and Mexican, 10 stamps running; Golden Eagle, 10 stamps, starts this month; Champion, 10 stamps running; Stonewall Jackson, 3 stamps running irregularly; Isabella, 5 stamps, starts again this month; Silver Nugget, 6 stamps running; Townsend, 5 stamps, starts up this month; Silver Era, 5 stamps, under repairs; Miami, 10 stamps, in litigation; Irene, 10 stamps, starts this fall; Mineral Creek, 5 stamps, starts this fall; McMillen, 3 stamps; Wheatfields, 5 stamps. It is the intention to have all of these mills in full running this fall, and as there is in the several mines a large amount of milling ore in sight, the result will be a long and steady output of bullion. There is also a company now being organized to build a narrow-gauge railroad to Salt river (20 miles), and there erect a large mill to run by water power. The company propose to contract for the large quantities of low-grade ore in sight in our mines and reduce them at from $9 to $10.

"Since the organization of the district there has been shipped to San Francisco and other places a considerable quantity of very high-grade ore. A ton of it was exhibited at San Francisco several years ago, which sold for over $20,000. It is difficult to get on the exact data as to the amount shipped, but from careful estimates we are sure its value was over $500,000.

"From our own knowledge, and after careful inquiry, we find that the total amount of bullion openly shipped from the district up to date is $460,000, and this is only the beginning. With all our mills going we will start this fall with a month'ly bullion production of at least $25,000."

Pima County.

Pima county is the most populous and prosperous portion of the Territory. Its county seat is Tucson, having at the close of 1880 a population of over 60,000. The county embraces the famous Tombstone and Harshaw districts, the Patagonia, Brushe, San Xavier, Oro, Blanco, Arivaca, Holland, Washton, Dos Cabezas, Dragoon, Washington, and other districts. It includes a large proportion of reduction works, mills and furnaces, and it produced more than the balance of the Territory during 1880. According to the reports of mining and milling companies and estimates made by the local press, the production as given in the local press was as follows:

	Silver bullion.
The Tombstone mills, Jan. 1 to Nov 30, 1880.	$806,249.02
The Tombstone mills (estimated), Dec. 1 to Dec. 31, 1880	107,194.28
Corbin mill, January to March, 1880*	36,000.00
Contention mill (Western Co.) silver bullion:	
Jan. 1 to Nov. 30, 1880	1,335 000.00
Dec. 1 to Dec. 30 (estimated)	165,000.00
Boston and Arizona reduction works, running July (part of the year)	46,624.98
Sunset mill (part of the year)	22,500.00
Harshaw mill (Hermosa mine), from Aug. 20 to Dec. 31	365,654.49
Holland sutter (trial runs)	20,000.00
Placer gold, Pima Co. (estimated)	18,000.00
From all other sources, as estimated by the *Citizen*, Jan. 1, 1881	100,000.00
Net yield Copper Queen (copper bullion), for four months ending Dec. 31, 1880	300,000.00
Total	$3,322,222.77

For the fiscal year 1879–80 the receipts of ore and bullion from Pima county, as reported for this Bureau, were as follows: Gold, $78,813; silver, $592,061.

The following details are taken from the *Citizen*, Jan. 1, 1881:

"The Tombstone M. & M. Co. submits the following report:

Value of bullion or silver bars produced from Jan. 1 to Nov. 30, 1880	$800,249.02
Value of bullion or silver bars produced from Dec. 1, 1880, to Jan. 1, 1881 (estimated)	107,194.28
Total for the year	$913,443.30

"Depth of shaft sunk during the year (5 shafts), 1,100 ft.

"Drifts—number of feet run during the year, 3,000.

"The Corbin mill was sold to the Tombstone Co. last March, after a short run, which yielded $36,000. There has been 150 ft. of shafts sunk on mines owned by the Corbin Co., and 100 ft. of drifts run. After the transfer above referred to, the yield from the Corbin mill is included in the Tombstone report.

"The Boston and Arizona reduction works report the shipment of bullion valued at $46,624.98. This was from 780 tons of ore crushed, and shows an average yield of nearly $60 per ton.

"The Sunset mill, under date of the 17th Dec., 1880, reported producing 10 bars of bullion from a short run, but failed to place a valuation upon the bars. The silver bars produced by the Tombstone mills usually run from $2,000 to $2,500. Taking it for granted that the Sunset bars were about the average, or, say, $2,250, we have, as the result of the Sunset, $22,500."

The bullion produced by the Contention mill is estimated at (for nine months) $1,200,000, as follows:

Value of silver bars produced from April to Nov. 30, 1880	$1,135,000
Estimated value of silver bars produced for the month ending Dec. 31, 1880 (estimated)	165,000
Total	$1,300,000

Of mines in the most southerly portion of the county, the *Citizen* has the following:

"The Harshaw Co. started up on the 20th day of August last; consequently, the result following is for but little more than four months.

Value of bullion or silver bars produced from Aug 20 to Nov. 30, 1880	$275,654.49
Value of bullion or silver bars produced from Nov. 30 to Dec 31, 1880 (estimated)	90,000.00
Total for the year	$365,654.49

"The smelter for the Holland mine has not fairly started up, though one or two successful runs have been made. The question of successfully treating these ores is now settled to the satisfaction of all concerned, and regular shipments of bullion will begin with the new year. Value of bullion produced so far, $20,000.

"The Copper Queen (at Bisbee, Mule Pass mountains) smelter started up the 1st of Sept. last, and with the exception of three days, has run continually ever since. The daily average yield of copper from this mine is 13,000 lbs., and as the smelter will have been in operation just 120 days, the total yield will be 1,560,000 lbs., which is worth 18 cents per pound in Baltimore, or $380,000, about $300,000 of which is net at the smelter.

RECAPITULATION.

Yield of the Tombstone Co.'s mills	$913,443.30
Yield of the Corbin mill	36,000.00
Yield of the Contention mill for nine months	1,200,000.00
Yield of the Harshaw mill for four months	365,654.49
Net yield of the Copper Queen for four months	300,000.00
Yield of the Boston and Arizona reduction works	36,624.98
Yield of the Sunset mill (a short run)	22,500.00
Yield of the Holland (trial runs)	20,000.00
Placer gold produced in Pima Co. during the year	18,000.00
Total value of gold, silver and copper produced in Pima Co. for the year ending Dec. 31, 1880	$2,912,222.77
Amount of silver bars and bullion produced from all other sources, including the Evans mill, the old Ostrich mill, the Derre mill, the Wetherill mill, the San Xavier smelter, and arastras operated within the county	100,000.00
Making the grand total produced in Pima Co. from all sources	$3,012,222.77

"There are six other mills in Pima county now ready to begin operations, and while we deem the above a good showing for what may be considered our first year's operations, we may safely calculate on more than doubling the above amount in the coming year.

"The actual yield of the Contention (now known as the Western) mine, as officially reported to the *Bulletin* by the secretary, D. C. Bates, is $1,214,055, that being the face value of the bars as shipped. The proportions of gold and silver are as follows:

Gold	$224,448
Silver	989,607
Total	$1,214,055

The Tucson *Star* of the same date gives the following, which differs somewhat from the above:

"The bullion production for mills of the Tombstone Co., Western, Sunset, Boston and Arizona, in the Tombstone district, and adds that of the Harshaw mill, in the district so named, with scattering sources, making a total of $2,678,930.55."

To this the *Star* adds as follows: "The placer gold product is estimated at $18,000; copper produced by the Copper Queen, 1,700,000 lbs.; net values at the mines, $323 000; making a grand total of $3,019,530.55 of bullion produced during the year. The T. M. & M. Co., and Corbin mill have been in operation since Jan. 1, 1880. The Contention started up in the latter part of April, the Harshaw, Aug. 20th; the Boston, Sunset, and other mills have run but a short time, and at intervals. The Copper Queen smelter commenced operations Aug. 20th. The San Xavier and Holland smelters have been experimenting as to the best method of treatment of ores, and are now prepared to produce good results. * * * There are 11 quartz mills, with 164 stamps; four more are under course of construction, with a total of 50 stamps, which will be completed during next month, and which, added to the former, gives 214 stamps, and will, in a short time, be working on ore. There are three smelters, with a total smelting capacity of 80 tons per day."

Yavapai County.

Yavapai county, in which is the Territorial capital, Prescott, shows quite a revival of mining industry. There is little data on which to base returns for the first half of the current fiscal year, but without question the bullion production has largely increased. For the fiscal year 1879–80 the following returns are made from San Francisco:

Gold	$3,374
Silver	251,399
Total	$254,773

Tip-Top, the largest producer in this county, returns as mill product for the calendar year 1880, $124,000.

The mining districts around Prescott are those in which the increase of activity and production would most assuredly be first made manifest. The production for the first six months of the current fiscal year will be underestimated, in a round sum, at $200,000, making a total for the 18 months under consideration of $454,773. The last calendar year's product can be safely estimated at $270,000.

Yuma County.

Yuma county has recently developed increased activity, especially to the south and east of Yuma City. Castle Dome district, on the Colorado river, and north of the railroad about 30 miles, has yielded in smelting ores shipped to the Selby works at San Francisco, during the calendar year, about $3,000 monthly, or $36,000.

Silver district, 50 miles south and east of Fort Yuma, is developing a dozen promising mines, of which the Silent is reported most favorably. A yield of $50,000 is reported in a local paper, but no authentication has been obtained. For the fiscal year 1879–80, only $1,800 in silver bullion is reported. Yuma county may be credited, however, for the calendar year, with a production to be estimated at $60,000.

Taking, then, the calendar year 1880 and grouping the careful estimates given, the following is the result obtained, in round numbers:

COUNTIES.	Gold.	Silver.	Total.
Maricopa	$100,000	$280,000	$380,000
Mohave	20,000	210,000	330,000
Pima	18,000	3,304,222	3,322,222
Pinal	80,000	1,324,379	1,404 379
Yavapai	5,000	265,000	270,000
Yuma	.....	60,000	60,000
Total	$223,000	$5,433,601	$5,566,601

That the foregoing estimates are not extravagant can be seen by the fact that in two counties alone, Pima and Pinal, over seven-tenths of their total production for 1880, amounting in all to at least $4,726,601, is embraced within the last half of the calendar year. It would be impossible to create so great a local activity as the figures exhibit without all other portions of the Territory feeling it, hence it is certain the estimate is a moderate one. The local press are claiming a total production of at least $7,000,000. With the progress now made and the increasing rapid development, it is not at all unreasonable to anticipate a total production for the coming fiscal year of from $8,000,000 to $10,000,000. The increase of reduction works is very great. Pima county had on the 1st of Jan., 1881, 11 quartz mills, with 164 stamps, in operation. It also had three smelting works, with a daily capacity of 70 tons. Several other mills and furnaces were on the point of starting at the date named. By the end of the year the stamp mills and furnaces will be doubled in number and capacity.

Pinal and Maricopa counties had on the 1st of Jan., in Pioneer district, one concentrating mill and two others with 30 stamps. The Vulture, Tiger, and the Wickenberg custome mill have 110 stamps in all. Pinal county has in Globe district, at Mineral Creek and Richmond Basin, 13 different mills, dropping in all about 90 stamps; Yavapai county about 45 stamps in operation, and Mohave county 30 stamps, while Yuma is reported as running 20 stamps, making 490 stamps in all and a half dozen furnaces, besides numerous arastras. At the end of 1879, there were not over 50 stamps in operation, and not a single furnace running.

The annexed tables give all the figures attainable at San Francisco for 1879–80.

Bullion Production of Some of the Mines of Arizona, as Reported to and Published in the "Mining Record," of New York.

MINE.	Calendar year 1879.	Jan. 1 to June 30, 1880	Fiscal year 1880	Calendar year 1880.
Contention or Western	.....	$437,754	$437,754	$1,048,986
Head Center	.....	17,000	17,000	17,000
Harshaw	.....	.....	.....	333,000
Hackberry	$18,608	.....	9,304	.....
Silver Nugget	.....	.....	.....	19,272
Silver King	288,300	180,000	324,150	454,022
Stonewall Jackson	28,800	4,000	18,400	28,500
Tombstone	.....	268,619	268,019	782 118
Tiger	98 900	17,000	66,450	17,000
Tip-Top	418,800	.....	209,400	124,000
Total	$353,408	$924,372	$1,351,077	$2,830,298

*Since March the product has been consolidated with the Gird mill. Both now belong to Tombstone.

Summary of Bullion Production in Arizona for the Fiscal Year 1879-80, by Counties.

COUNTIES.	Gold.	Silver.	Total.
Maricopa and Pinal	$90,662	$266,543	$357,205
Mohave	17,350	178,329	195,679
Pima	78,813	513,248	592,061
Yavapai	3,374	251,399	254,773
Yuma		1,800	1,800
	$190,199	$1,211,319	$1,401,518
Unreported sources	200,000	800,000	1,000,000
Total	$390,199	$2,011,319	$2,401,518

Two hundred thousand dollars gold and $800,000 silver are added to thie Territory es from unreported sources, to cover the known yield of two mines refnsing the information.

Interference of Telegraph Wires.

The multiplication of telegraph wires, especiallly in cities, is ceusiog much tronhle and no little danger as well, especielly where the large electric light wires are interwoven with the nnmerons telegrsphic and telephonic linee. When one wire comes into nesr contact with another, the electricity passes and repasses in small amonnts from one wire to the other nntil neither is of any service in conveying sigoals or sounds. This is is specially the csse in wet weether, particnlsrly if a few spider webs, or other small connections are made hetween the wires. The process of indnction is often made audible, especially in the demp and stillness of night, and mey he recognized hy the peculiar humming which is heard on pnt'ing a telephone receiver to the car. When this ioduction process is nnusnslly strong it often makes itself knowo hy a violent and prolonged ringing of telephone hells.

There are also many other dangers, which experience will in time teach us to avoid. If a heavy electric light wire should drop npon a telephone wire, and swaying hy the ection of the wind, should cut through the insulation of the former a heevy current of electricity would at once find its way into some telephone box with dengerons effect. An operator might receive a severe or possibly e fatel shock; or a fire might he sterted in some obscure corner.

A peculiar case occnrred a few evenings since at the Risdon Iron Works in this city, where the electric light is nsed. An electric fleme was seen to hnrst snddenly from one of the halices, or coils, similer to thet seen in the lamps. The cnrrent was at once ont off to avoid danger or demage. An occnrrence of the kind in any nnobserved place might have resnlted in a serions conflegretion. The fleme was prohably censed hy a smell splinter of iron getting into the coil and wearing or rusting off the insnlation hetween two portions of the wire, that estehlishing a cross current, which manifested itself as ahove.

We mention these facts not to discourege electric lighting, or the nse of electricity in eny way, hut simply to diffuse some usefnl informetion in regerd to the proper cere to he observed in its nse. Electricity is destined, et an early day, to hecome an important egency—not only in heavy mechenical and manufactnring operations, hnt also in the every-day life of our cities generally.

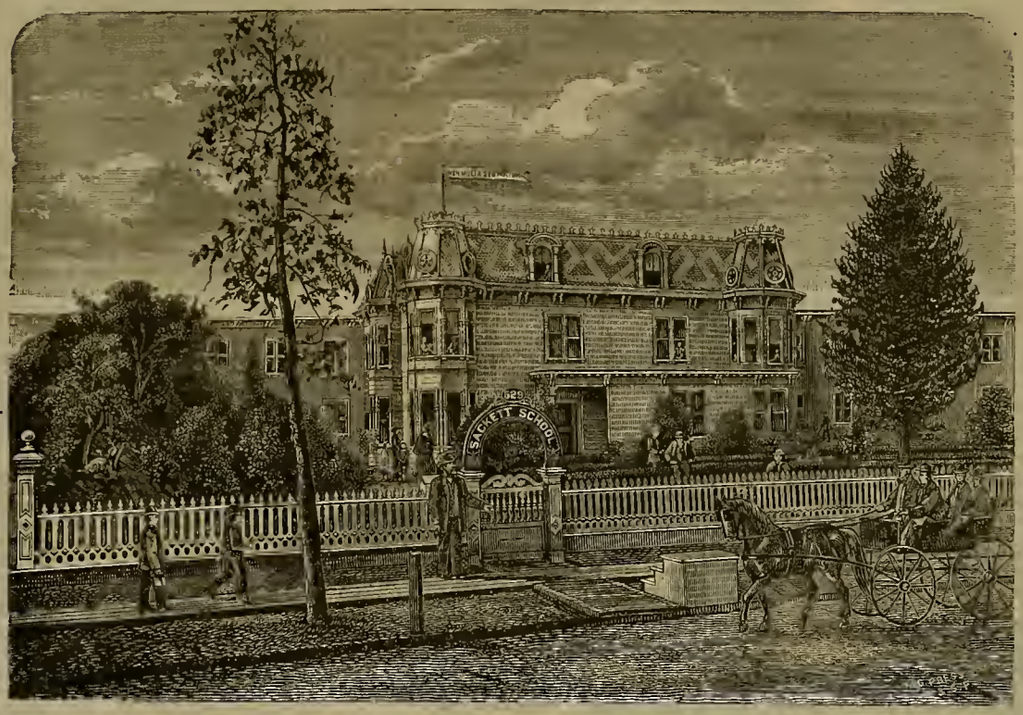
The only wey to avoid eccidents from electric wires and lights, is for those employing them to he thoioughly informed in regard to their use, and to see to it that all wires needing protection are thoroughly insulated, and otherwise secnred from the possihility of denger.

A Big Sale of Mines.—A Mr. Rohinson, a mining expert of some note throughout the Stete, was here last week and negotiated for the purchase of severel of the mines at Heyden Hill, in fact, nearly all of them, for a London compeny. Tbe principel of the mines is the Juniper, for which the sum of $500,000 is to he paid; the other mines, some seven or eight in nnmher, are hargained for at $115,000, making a grand total of $615,000. Mr. Rohinson assured ns that the money would be in San Francisco and the hargains closed hy Christmes. He expresses the helief that they ere the hest mines in the world, for the reasons thet the ore is the richest and hecanse there is so little hase metal in it. He penned a little dirt from one of the mines, and said a ton of such dirt was worth $100,000, and found plenty of dirt thet was worth from $1 to $4 a pound. If these stetemeots are not exaggerated, the company pnrchesing these mines have the finest mioiog property in the world.—*Adin (Modoc County) Argus.*

An Immense Planer.—The Betts mechine company, machine tool huilders, of Wilmington, Del., heve just completed and are now shipping one of the largest machine tools ever constrncted. It is a huge mechine, capahle of planing a piece of iron or other metel 10 ft. wide, 10 ft. high and 24 ft. long, and so arranged that four cutting tools may operate on the work at one time—two of these are on the cross-head, and one on each upright. The hed-plate is a massive cesting, 6 ft. wide and nearly 40 ft. long, weighing nearly 40,000 lbs.; each upright weighs ahout 10,000 lbs., and the total weight of the tool is 120,000 lbs. It is hnilt on order for one of the lerge engineering works in the West, and is the eighth machine that will plene 10 ft. sqnare thet has gone out from these works, though they are not ell so long as this one.

Patrick McGorrisk, a well-known prospector and discoverer of the Oro Blanco district, Arizona, died last week in Arizona,

The Sackett School, Oakland, Alameda County, California.



The Sackett Boarding School hes in a hrief time gained a leading position emong the meny private schools of Oaklend, which fact affords the hest possihle proof of snperior merit. The Principal, Mr. D. P. Seckett, has heen long and favorahly known there es a teacher and disciplinarian. The location of the school is convenient, healthful and attractive. The comfort and well-heing of the stndents is an especial feature of the domestic depertment, and the moral end physical training of the pupil is carefully condncted.

In their mentel training great prominence is given to the fundamental hranches which mnst enter solidly into all gennine edncation. This institntion is the yonngest of the many private schools across the hay, and has shown rare vigor and enterprise in many ways, and more particnlerly in providing the most competent teachers. D. P. Sackett, of Yale College, is the Principal; George W. Drew, A. M., of Yale College, is head master; Allen E. Jenvier, A. B., of Yale College, is in charge of the English Department; Mery K. Culhertson, State Normel School of New York, has charge of the department of Netural Science; end Mrs. George W. Drew has the department of Musio.

Twice hes the huilding (shown in the engraving) been enlarged and heautified until now it stends ont es one of the finest edncational ornements of the Athens of the Pacific. The grounds are as home-like and cheerful es those of any private residence, and one feels at once thet the young men who heve a school home there are comfortahly situeted. Yonng men from the interior would do well to send for catalogues, as speoial adventages are provided for them in the courses of instrnction.

BELTING and LACING
FULLED RAWHIDE ROPE,
Manufactured by
HERMAN ROYER, 855, 857, 859 and 861 Bryant St., San Francisco.
(ESTABLISHED 1868.)

TONITE POWDER COMPANY, - - 403 California St., S. F.

ENGINE LATHES IN SECTIONS.

Limit of weight for 25-inch Lathes, 300 pounds. For 17-inch Lathes, 150 pounds.

READY WITHIN 10 DAYS,

Standard and Special Machine Tools.

SAN FRANCISCO TOOL CO., No. 21 Stevenson St., San Francisco.

The Undersigned are Agents for, and are Prepared to Furnish Prices and all Particulars for

THE BALDWIN LOCOMOTIVES, every style and for any service.

THE BALDWIN STEAM MOTOR for use on City and Suburban Roads.

FREIGHT CARS, PASSENGER CARS, STREET CARS, } From BILLEMEYER & SMALL CO., and J. M. JONES & CO.

CAR WHEELS. from A. Whitney & Sons.

MINING ENGINEER,
Room 75, 115 Broadway, New York.
☞Agent for PADDOCK'S Ore Dressing Machinery. Mining Machinery supplied.

San Francisco Cordage Factory.
Established 1856.
Constantly on hand a full assortment of Manila Rope, Sisa Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.
Extra sizes and lengths made to order on short notice.
TUBBS & CO.,
611 and 613 Front Street, San Francisco

Arizona Cities and Towns.

Ws condsnss the following information about the cities and towns of Arizona from the pamphlet on the resonrces of Arizona.

Tucson,

Ths principal city in the Territory, stands on ths verge of a great mess, on ths east hank of the Santa Cruz river. The mesa is an extsnded plain, hounded hy short mountain ranges, between which the mess continues. Tucson is said to havs hsn estahlished asa Spsnish military station, to protect the Mission of San Xavier, ahout 1694. The town prssents ahout the sams appearance as ths Mexican towns of New Mexico, heing mostly huilt of sun-dried hricks or adohes. Since the completion of the Southern Pacific railroad and the hnilding of a fine hotsl snd depot hy the compsny, the place has taken a new impetus. We see some fine residences and puhlic huildings. The Catholic cathedral, huilt of brick and adohes, is the most imposing structure in the city. Thsre are Methodist, Presbyterian and Baptist churches; Odd Fellows, Masons, Knights of Pythias, Good Templars and Workmsn; two hanks and numerons hotels; thrss daily and weekly papers—Arizona *Star*, Arizona *Journal*, Arizona *Citizen*, and a Spanish Mexicsn paper—*El Fronterizo*. There are suburhan retreats, a silver lake, a heautiful drive down the valley of Santa Cruz to the old Mission of San Xavier, miles of dusty streets and adohe walls. Groves line the river, and mesquite trees are scattered over the mesa.

Tombstone,

The principal mining town in Arizona, the county seat of Cochise county, stands on the mesa toward the south end of the Dragoon mountains. Its streets are enlivened hy nearly 7,000 souls. It is located 70 miles southeast of Tucson, and 28 miles south of Bsnson, on the S. P. R. R., and on the direct line of the Atchison, Topeka and Santa Fe railroad to Guaymas. A hranch road is at present heing constructed to connect it with the Southern Pacific at Bsnson. The road is at present completed to within ahont 14 miles of the city. The first house was erected here in 1879, since which time it has grown as if by magic. It is hnilt of wood and adohes. There are many fine husiness houses, a large thester, four hotels, two hanks and many heautiful residences.

It contains four churches—Methodist, Presbyterian, Episcopal and Catholic—hesides the various Ordsrs are well represented, puhlic and private schools, with an attendance of ahout 400.

It is the center of the richest mining section in the Territory.

Prescott,

The capital of Arizona, is located in a little valley, partially surrounded hy the Sierra Prieta or Black mountains. The low hills are covered with timher aud grass. The town is well laid out with hroad streets. The courthouse is a handsome brick structure, with mansard roof. Unlike many of the Arizona towns, the huildings are of hrick, wood and stone. It has many fine stores and residences, some of the private residences heing very handsome. Its surronndings are heautiful and the climate mild and healthy. There are many interesting remains of ancient Indian towns in the vicinity, and it was evidently the seat of the first attsmpts at civilizstion in the Territory. All the Orders and churches are well represented. There is one hank, two good hotsls, two newspapers, the *Arizona Miner* and *Arizona Democrat*. Its elevation ahove the sea is 5,500 ft., and the population 2,500.

Phœnix.

In the valley of the Salt river (on the hanks of the famous stream up which all defeated politicians are supposed to travel), is 28 miles from the Southern Pacific railroad, at Maricopa station. Canals carry the water over the vallsy, which is fertile. The valley, formerly a harren desert until the first settlers in 1870 changed the face of nature, making it at this time, hlossom as the rose.

The streets of the town are wide, and are shaded with large cottonwood trees. There are clsnrches and Lodges of the popular Orders. Its population is ahout 2,000.

Globe.

The shire town of Gila county, is located on Pinal creek, a small hranch of the Salt river, 120 miles from Wilcox, on the Southern Pacific, or 90 miles from Florence, to the northeastward, in the midst of a mineral region, with a population of 1,500, and is improving. Two papers are published here, which represent the interests of the country—the *Chronicle* and *Silver Belt*.

Florence,

The largest town in Pinal county, 25 miles northeast of Casa Grande, on the S. P. R. R., in the valley of the Gila, is one of the most attractive towns in Arizona. It stands amid groves of cottonwood and other trees; the water heing led in small canals along the streets, and the dooryards are fresh with hlooming flowers. It has hut a slight elevatiou above the sea, and is consequently warm in summer. The buildings are mostly adohes. It is the center of the hest farming section found along the Gila, and has a population of perhaps 1,000. Mines of more or less value exist in the surrounding mountains.

Mineral Park,

An adobs-built town on the westsrn slope of the Cerbat mountains, occupies tbe center of a mineral region, with a population of 500. It is 10 milss from the railroad.

Pinal,

Locsted on Queen creek, depends on the Silver King mine, the mill of the company hsing located here. It has a population of 600, and is prosperons. The houses are of wood and stone, a light calcareous tufa found in the immediats vicinity.

Harshaw,

A wood-built town, 70 miles southwest of Tucson, with which and Sonora its trade is dons, has a population of 600. The hills surrounding ths town are covsrsd with timhsr and grsss. The mill of the Harmosa M. Co. is locatsd hers.

Silver King,

At the cslebrated mine of the ahovs name, has a population of 300, who either work in the mine, or depend on it for husinsss. It is five miles from ths town of Pinal.

Charlestown,

Ten miles from Tombstone, on the San Pedro river, where ars located the mills and rsduction works of the Tombstone Mill and Mining Co., is a small town, of perhaps 300 inhahitants. A station is now bsing built at this place, which the railroad will reach in a few days.

Galeville,

In the Chiricahna mountains, 20 miles from the Southern Pacific railroad, and near the line of New Mexico, stands on the oak-covered mountain slope. Started in 1880, it has a population of 400. Water, wood and fine feed ahundant.

St. Johns,

County seat of Apache county, on the hanks of the Little Colorado, near the New Mexican line, is the center of a farming and good grazing conntry. The town has a popnlation of 700, mostly Mexicans, and is on the line of the Atlantic and Pacific railroad.

Safford,

Graham county, is the center of a farming and grazing country. Population 300.

Physical Geography of New Mexico.

New Mexico is one of the largest of the Territories. It is situated hetwesn the 31st and 37th parallels of north latitnde, and the 103° and 109° of west longitnde; has a length of from 350 to 393 miles, and a breadth of 335 miles, and contains 121,000 sqnare miles. It is hounded north by Colorado, sonth by Texas and Mexico, west by Arizona, and east by Texss and Indian Territory. The general surfaoe consists of high, level plateaus, traversed hy ranges of mountains, hetween which are many wide and fertils valleys, while occasional isolatsd peaks of great hight occur.

The chief river is the Rio Grande del Norte, which flows south throngh the center. The Pecos flows south through the eastern division to join the Rio Grande in Texas, and these two rivers receive many small tributaries. The northeast is drained hy the Canadian and the northwest by the San Jusn river; while the Gila and Chiquito Colorado have their origin in the southwest. The valley of the Rio Grande has an elevation of hetween 5,000 and 6,000 ft. near the northern houndary, and 3,000 ft. at El Paso. On each side of the valleys of the Rio Grande and Pecos, the mountains have a general altitude of 6,000 to 8,000 ft., while some rise far ahove the snow line, which in this latitnde is situated at an elevation of ahout 10,000 ft. Most of the mountains and streams have a general direction north and south. The Rocky mountains are here divided into two ranges, of which the easteru contains the highest peaks, and extends to within a few miles of Santa Fe. South of this range, a lofty platean extends hetween the Rio Grande and the Pecos, hroken, however, hy nnmerous smaller ranges. In the west, the great range of the Sierra Madre extends into Mexico. The country wsst of this is less known than the eastern region, hut is helieved to he fertile, and to contain great mineral wealth, as yet entirely undeveloped. It consists of numerous and extensive table lands or mesas, with detached ranges of mountains enclosing many heautiful valleys. In the extreme southeast is the Llano Estacado, or Staked Plain, which covers many thousand square miles, and extends a considerahle distanoe into Texas. This consists of an elevated tract, destitute of wood, and almost entirely unproductive. With this exception, the land, where susceptihle of irrigation, is generally valuahle for agriculture and grazing. There are no fresh watsr lakes of any importance, hut salt lakes, or salinas, are ahundant, particularly hetween the Rio Grande and the Pecos, south of Santa Fe, and from these, large supplies of salt are obtained for the use of the Territory, and adjacent provinces of Mexico.

Climate.

The great differences in latitnde and elevation give rise to wide variations in the climate of the Territory. The atmosphere is clear and dry, and pulmonary and miasmatic complaints are scarcely known, the proportion of deaths from consumption heing smaller than in any State or Territory, with the exception of Arizona. In the mountains the winters are sometimes severe; on the plateaus and in the river valleys, especially of the south, they are remarkahly mild, the temperature seldom falling helow the freezing point. In this locality the rainy ssason is in July and August. The annual precipitation varies from 10 to 30 inches, according to location. The mean annual temperature at Santa Fe, at an elevation of nearly 7,000 ft., is 50° Fahr.; that of spring, 49°, summer, 70°, autumn, 50°, wintsr, 31° Fahr. Ths highest temperature recorded was 88°, the lowsst, 5°. The summsrs are long and warm, hut extreme heat is rarely experienced, owing to the slevated position of tbe oountry and the frequent hrsezes.

More About Water Supply.

Ths demand on ns for information has recently hsome so grsat that we are unahle to reply to the letters daily recsived, and we have thus found it nscsssary to puhlish this additional circular, and to provide the means for meeting the dsmands of those who dssire wells for domestic, stock and othsr purposes. As a large dsmand for the *points* used in the construction of the driven wells has rscently arissn hers, it has occurred to us that many of them are heing put down without authority or license. *The purchase of the point does not give the legal right to put down and use a well.* The driven well is the invention of Col. Nslson W. Gresn, of New York, and is secursd to him by letters patent No. 73,425, No. 4,372 (re-issued) and No. 218,875. These patsnts have heen exhaustively litigated in the U. S. Circuit Courts, in the States of New York, New Jersey, Massachusstts, Iowa and Minnesota, and in every instance decided in favor of Col. Green. Because of the immensa value and utility of these inventions, combinations of large means and influence have hsen made at different times to defeat the collection of royalties and licenses. In one of these csses reported in 13th Blatchford, page 208, 19 days were occupied hy the most ahle counsel in the argumeut, and over 3,000 printed pages of evidence and hriefs were hefore the court on hehalf of the plaintiffs alone, and the expenses of the suit were over $100,000. The opinion was prepared hy Judge Benedict, and completely estahlished Col. Grsen's claim at every point. Judges Dillon, Nelson and Blatchford have all rendered opinions to the same effsct; and in a hundred other cases, arising out of collateral matters, have ths title and right of Col. Green heen most fully sustained. Our object in making these statements is to

Caution

All persons against the use of the driven well without authority, and to say that no person or persons have the legal right to put down or uss a driven well in California without authority or license from us. We are the exclusive agent and attorneys of Col. Green, for the States and Territories west of the Rocky Mountains, and intend to enforce and protect his rights, as well as onr own, to the uses and henefits of these patents. Should any person offer to put down a drivsn well for you, request him to exhibit his anthority from ns, and if he is not ahle to do this, you may rest assured that you will he required, soonsr or later, to pay licsnse to us.

To answer the constantly increasing demand for information, to guard against.

Fraud and Imposition,

And to supply the orders as fast as thsy may arrive, we have made arrangements with the well-known house of

Huntington, Hopkins & Co.

To kesp on hand all materials necessary for the construction of these wells, which will he shipped hy them on receipt of the price statsd. Upon the receipt of such order by them, or us as stated below, a full aad minute letter of instructions as to the manner of constructing these wells, will also he sent, so that anyone of ordiuary sense can put them down as perfectly as those especially engaged in the business. This letter of instructions—*together with the license*—will he sent with the goods. The articles sent will include everything necessary to a complete and perfect well, and also a pump of sufficient capacity to deliver 900 gallons of water per hour. Without this letter of instructions, and careful attention to the directious it contains, it is more than likely that the attempt to put down a satisfactory well would fail, and thns the goods furnished would prove a partial loss. In adopting these meaus of putting the driven well within the reach of everyone, the expenses of employing an expert, so called, are avoided, and ths cost of the well is therehy so reduced as to he within the reach of everyone. One of these wells can he easily constructed hy two men in two days—usually in ons day—to a depth of 50 ft.

Where several wells are required in the same neighhorhood, the work can he greatly facilitated hy purchasing a few additional tools, costing not over $20. These may hs returned to us, if not hroken, and one-half of the purchase price will he refunded.

When desired, we will send an expert, for cost of transportation and $5 per day. Contracts for large water supplies will he entered into hy us upon the most favorahle terms—*upon the basis of success or no pay*.

Material for wells not more than 40 ft. in depth, including pump and license, will he sent for $45. Wels of 50 ft. will he supplied for $50, and for each foot over 50 ft., at 40 cts. per foot—to be sent, *in all cases*, hefore the goods are shipped.

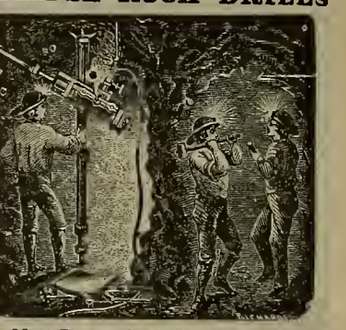
In sending your order, it will he of advantage also to send us as full and accurate a description of the proposed location of the well, the distance—or supposed distance—of the water heneath the surface, the nature of the soil from the surface down—so far as known, the thickness of the differsnt strats, and any othsr facts likely to he of advantags to you and us in writing our letter of instrnctions. In any case whsre, from the statement of facts, we ars satisfied watsr cannot he ohtained in satisfactory supply, ws shall so state, and will immediatsly return your money.

We refer, by permission, to: Chas. Millsr, Esq., of Huntington, Hopkins & Co., junction of Bush and Market streets; Lsmhert & Gresn, manufacturers of H. & L. axle grease, 144 Natoma street; M. P. Holmes, carriage manufactory, 327 and 329 Sutter street; Judge Robert Thompson, 76 Montgomsry Block; R. H. McDonald, Presidsnt of the Pacific Bank. All of San Francisco.

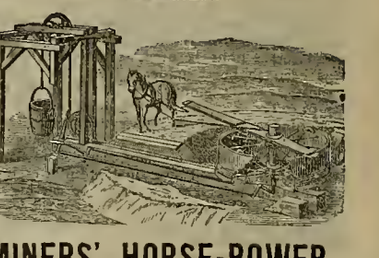
For circulars and other information, address Babcock, Howard & Co., 40 Merchants' Exchange, S. F., Cal.

Note.—No lettsr of instrnctions will hs ssnt, except it is sent with the goods.

INGERSOLL
ECLIPSE ROCK DRILLS



The Moet Economical Air Compressore in the Market.



MINERS' HORSE-POWER.

One Horse can easily heist over 1,000 pounds at a depth of 500 feet. The Power is mainly huilt of wrought iron. The hoisting-drum is thrown out of gear hy the lever, while the load is held in place with a brake hy the man tending hucket. The frame of the Power is holted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

The Big Bend Tunnel.

(CONTINUED FROM PAGE 400.)

gan, of Oaklnnd, Cal., and Major Frank McLanghlin, of New York. These gentlemen took hold of the project in a characteristio, energetic way, nud had it exnmined hy engineere and mining experts. Then they went to work nnd took np somo 13 miles of the river hed and got it coverod hy U. S. patent. It happened to he on unsurveyed Government lande, and so could be taken up without consideration of the legnl subdivisions. This patent, hy the way, ie the largest ever issued hy the U. S. Governmont, and the snrveye above cost over $4,000. Hon. R. V. Pierce, of Buffalo, and Waldermnn Allstrom, of Chicago, also associnted tbomselves with the gentlemen mentioned.

Of couree, a project with the appnrent hrilliant proepecte poseeeeed hy this could not etend long in the market, and it has been stocked and sold, and preliminary work hegun. Roads and honses are heing built, and it is intendod to hegin work on two fnces of the tnnnel itself in April next.

The north fork of the Feather rivor rises at Lassen's peak, where the melted enow percolates throngh the fissnres in the lavn below the cap, and gush forth in one immenee body, creating, as it were, a river instnntaneously, at the head of Big Meadowe. From thie place it continues its couree throngh Laesen, Plnmae and Butte-counties, a distance of 100 miles, nntil it renchee tbe point selected for the bead of the tnnnel.

The couree of the river at Big Bend is shown in the accompanying mep. The peninenla of Big Bend ie composed of high mountain land with precipitous hanke to the river. The area is about 11 eqnare milee, and length of the river to he drained is 12 milee.

The following facts concerning the project we condense from the report of Jno. D. Barry, the engineer who exnmined it for the owners:

The tunnel begine nearly half a mile above Whisky Bar, at a plnce where the river is deeply encaved hetween the henks, and where the stream has very little fall. It ie proposed to estahlieh the hottom of the tnnnel four ft. helow the lowest portion of the stream, in order to give the impetus to the watere, taking a greater velocity than they had in the etream, and in order to obtain at once the required depth of water in the tunnel which it is provided to carry on its wbole conrse.

On the accompanying longitudinal section are shown the different natnree of ground that will he encountered in the driving of the tunnel. These rocke are claeeed provisionally only, as also the width of the different strata. It ie impossihle to give positive namee to rocke in California without cutting microscopic sections, and eometimes chemical analysis is aleo neceseary.

Thie Big Bend tnnnel will he 11,600 ft. long, 25½ ft. wide, 21½ ft. high, and the excavations will cost ahout $4 per cnhic yard. At the entrance of the tnnnel will he a permanent dam across and up to the level of the hed of the stream. On thie csn be erected a dam, on the Bayot plan, as used in the Cher and Loire rivers, that can he thrown down and erected again in n short time, or a temporary construction can he built each year.

One of the engravinge repreeents a cross section of the river hed. *A* is a line ehowing the highest floods (extnrordinary years); width, 245 ft. *B* showe highest floode (ordinary years); width, 189 ft. *C* showe the level from June 1st to February. *D* showe the water level from July to Decemher. *E* shows the water line in Octoher, 1880. The diecharge of the river at the latter date wae estimated at 2,019 cnhic feet per eecond. The tunncl would he large enough to carry all the water of the river, nnder ordinary circnmstances, for enough monthe in the year to allow of very profitable work.

Mr. Barry makes two estimates of cost—one, for 155,037 cnbic yards, at $4, which, with machinery, compreesors, tools, huildings, roads, weirs, sluice gatee, ventilating hore holes, engineering expensee, etc., amounts to $800,000; the other, with the same expenses, except that 207,230 cnhic yards are to he excavated, amounts to $1,000,000. Some of the water may he utilized for irrigating pnrposes.

Mr. Barry eays that experienced miners who have heen in the neighhorhood since 1850, estimate the value of tbe gold in the river hed aronnd Big Bend at from $50,000,000 to $150,000,000.

Prof. Thomas Price, who reported on thie property for the owners recently, in answering the question as to the river containing sufficient gold to justify the expenditure, says: "I can only reply that, from the fact that this portion of the Feather river hae never heen worked eystematically, and that hoth helow and ahove it, wherever it has heen poseible to wash on the river, very remunerative results have heen obtained, notwithstanding that hut in few places has the hed of the river heen reached. Ahove the point of intended diversion of the river it is well known that the modern stream has intersected and cut out the gravel of the ancient etreame which were rich in gold, hesides which the tailings from the exteneive early placere, drifte and hydraulic mines have found lodgment in this stream, the freshets of each winter have carried away the debris, and to a conaiderahle extent the gold has concentrated here. Whenever it has heen possihle to wash on the Big Bend, as it is called, good results have heen obtained. A very large number of claims on the Feather river have paid well. I will mention a few that are conaidered good, as illustrations. The Cape claim was wingdemmed in 1856, nnd paid handsomely. The same portion of the river wae flnmed for a length of 3,300 ft. in 1857, at a cost of $120,000, and over $600,000 was obtained in 40 days. Somo days the product reached $21,000. The winter rains came on and carried all the improvemonts away. This claim is still rich, hut the extensive mining above has covered the bedrock with a large and thick deposit of gravel, and it is not worked on account of tho uncertainty of tho dry season heing long enongh to get ready in time for washing sufficiently long to enable profitable rcoults to he obtained. The Private compnny's clnim has the reputation of heing very rich, and at the Slote olnim it ie stated thet over $100 per pen of 30 lbs. of gravel was obtnined. The Ohio claim, immediately above the Slote claim, had the reputetion of heing very rich. The Sailor claim worked in two yenrs some 500 ft. on the river without reeching bedrock, the yearly profits heing $40,000.

Several other clnims hetween Oroville and the weet branch of tbe Feather river paid lnrgely. One Huhhard flumed 400 ft. of the Big Bend, near the mouth of the west branch of the Feather, roalizing, it is etated, over $40,000.

The Union Cape claim was flnmed nnd paid in one eeason $275,000. At every point, for a distance of 60 milee ahove the Big Bend, wherever the river has been washed, very profitahle resnlts have been produced. At the present time two portione of the river above the site of the proposed tunnel is heiug washed by 29 Chinamen, and it is claimed that they are extracting from $200 to $500 per day. In none of theee varione claims have they heen ahle to get down to the bed of the river, as the season ie too ehort; about 40 days is all the time they have, and some eeasone not over 10 daye, hefore the etreame commence to rise and carry away all the improvements.

All the hare in the Big Bend have the repntation of having paid well. It ie claimed that over $1,000,000 was taken from Toland har in the eeasons of 1856 and 1857, and it has been worked every year since. All the tributeriee of the North Fork have heen very rich.

"From the foregoing facts and well-known richness of tbe Feather river and many of its tributariee, wherever they have been worked, there ie every reason to helieve that the 12 milee owned hy your company containe a very large amount of gold. All that is necessary to render it availahle is to divert the waters from the stream, so ae to he able to work continuously for several months each season—a condition that is availahle only through this scheme."

Prof. Price thinke the feesihility of the tnnnel only a question of finance, and that all the water of the North Fork could he paesed through it in the fall and summer monthe. The tunnel may also he rendered availahle for saving considerable gold that may he carried into it from the gravel above ite mouth; so that really mnch of the river above the so-called Big Bend mey yield its valuahle gold. I see no reason why this enterpriee cannot he made a successful one, hoth from a practical and financial point of view. To carry it out only requires engineering skill, time and money.

This project is one that will he watched with interest, as when it is completed it will demonstrate facts of value to the mining community in this State. There may he, and doubtlese are, other localitiee where similar plane may he adopted, provided equnlly energetic men take hold of them.

An Extra Edition.

This number of the MINING AND SCIENTIFIC PRESS is devoted largely to the intereets of Arizona end New Mexico. The edition ie one of 32 pages, double the numher we usually print each week, and is quite fully illustrated.

Of course it is impossihle to give more than hrief notes of such extended areae as are comprised in these progressive Territories; yet we have in this number compiled a great deal of information ahout them. We sent a epecial corresponnent to Arizona to collate information for us, and the results of eome of hie work appear in this issue. Valuahle articlee for preservation and reference aleo appear. In a portion of the edition we puhlish a revised map of Arizona, showing the railroad lines, etc., and any of our old readere who may specially wish a copy of this map can have it by applying at thie office.

MR. THOS. A. EDISON, the talented yonng inventor, whose genius ie nndonhted by those who know him heet, continues his investigations and lahore in perfecting the electric light and its appliances. No one has contributed more to progress in thie direction than thie young man. We predict that it will not he long before he completely proves the success of hie invention, as it is not prohahle one of his great talents would persevere in schemes which are likely to prove futile. He hronght honor to the American name in the recent exhihition in Europe, and will further exalt it, we feel certain. Mr. Edison is turning his attention more particularly to a light for household purposes—something we really need more than street or puhlic lights. Mr. Edison will before long demonstrate the practicahility of his lights to the general puhlic, ae he hae already to many persons; hut he ie right in keeping hie business to himself until he is ready for work.

TO HYDRAULIC MINERS,
RAILROAD CONTRACTORS,
And others Engaged in **BANK BLASTING.**

HAVE YOU TRIED THE

GRANITE BLASTING POWDER?

If you have not, give it a trial and yon will he satisfied that it will do more work for less money than any Powder in the market, nnd refer to numerons testimonials in support thereof to he found at our office.

Put up in kege of 25 lbs., either glazed or not, to suit customers.

GIVE US A TRIAL.

PATENT ELASTIC HINGE
FILEHOLDER,
A.T. DEWEY, S.F. CAL.
A eample File-holder sent poet paid, from thie office on receipt of 50 cents.

This is the best durable file-holder in use. Send for eample, or further nformation, to this office.

BOONE & MILLER,

Attorneys & Counsellors-at-Law,

Rooms 7, 8 and 9
No. 320 California Street, S. F.,
(Over Wells, Fargo & Co.'s Bank.)

Special Attention Paid to Patent Law.

N. B.—Mr. J. L. Boone, of the above firm, has been connected with the patent business for over 15 years, and devotes himself almost exclusively to patent litigation and kindred branches.

AMERICAN EXCHANGE HOTEL.

Sansome Street, (Opposite Wells, Fargo & Co's Express), San Francisco.

This Hotel, under the management of CHAS. MONTGOMERY, has been thoroughly renovated, and being in the very center of all the Banks, Insurance Offices and Commission Merchants, it offers special inducements to Merchants from the Interior and Farmers.

Board, with Room, $1, $1.25 and $1 50 per day. Special rates by the week or month.

FREE COACH TO AND FROM THE HOTEL.

F. MANSELL & CO.,

Sign and Ornamental Painters,

Removed to NO. 434 PINE ST., S. F.

(Opposite their old stand.)

E. MAIN, 315 Folsom Street,

Makes to order Gents' Fine French Calf Boots from $6 to $10; Gaiters from $3 to $6; Alexis from $3.50 to $5; Mens' Heavy Kip Boots, $5; Oxford Ties, French Calf, $4; California Leather, $3.50; Men's Working Shoes from $2.50 to $3; Children's Shoes made to order. Persons in the country ordering to the amount of $12, I pay the express charges. I sell nothing but my own manufacture.

Mining & Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

Address,

DEWEY & CO.,

252 Market St., N. E. Cor. Front

San Francisco.

J. H. WYTHE, M. D.

Residence: 935 West Street, Oakland. Hours 10 A. M., after 5 P. M.
Office: 759 Market St., San Francisco From 11 A. M. to 3 P. M.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

THE FRANKLIN GIRDER!

BY FAR THE MOST ECONOMICAL OF ANY CONSTRUCTION MADE.

—o—

This new and economical Girder for Buildings and Bridges, made of any desired length and to sustain any required load, and guaranteed to be fully up to the sustaining capacity represented. The price of these Girders is ABOUT ONE-HALF the price of those of same length and same sustaining capacity in common use in this city. The value of this invention has been most favorably commented on in full by most of the scientific press of this country, as the SCIENTIFIC PRESS, *Scientific American*, *Railway Review*, *The California Architect and Building Review*, *The American Architect and Builder*. A Girder 25 feet long, made for 17-inch wall, with about 2 feet of brick wall on it, is now in front of premises 231 First St., above Shot Tower. This Girder held on the top of the brick wall now on it, 117 Tons and 1,741 Pounds of Railroad Iron, at the Pacific Rolling Mills, piled directly over and between supports, and it would have held, in the opinion of experts 200 tons, as the deflection was not a quarter of an inch below the true arc. The foundation on which the Girder rested, settled 7 inches, so that the loading had to be stopped at the above weight.

The Price of these Girders, 25 feet Long, to Sustain 100 Tons as a Safe Distributed Load, $200.

THOSE IN COMMON USE NOW IN USE IN THIS CITY COST NOT LESS THAN $400.

And other sizes in like proportion. Every Girder guaranteed to sustain the load as a safe one; the breaking load being three times greater.

Prices for any Size and Sustaining Capacity given on Application.

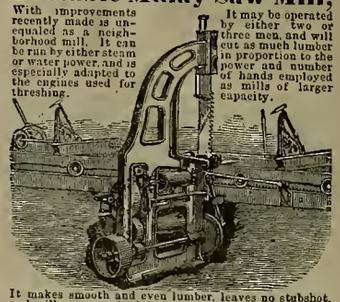
P. H. JACKSON & CO., Makers,
2 California Street, and 231 First Street, San Francisco, Cal.

P. H. JACKSON,
Civil Engineer.

PATENT RIGHTS FOR STATES FOR SALE.

Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.



It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.

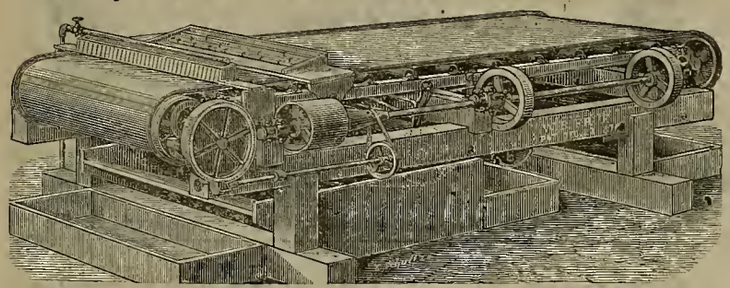
It makes smooth and even lumber, leaves no stubshot, and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to CHANDLER & TAYLOR, Indianapolis, Indiana.

We also build the heavy Standard Circular Saw Mill, with either one or two saws as well as the Pony Circular Saw Mill that is capable of being run with light power. We also build Stationary Engines of varied capacity; also, portable Threshing Engines.

THOS. PRICE'S

Assay Office and Chemical Laboratory,
524 Sacramento St., S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

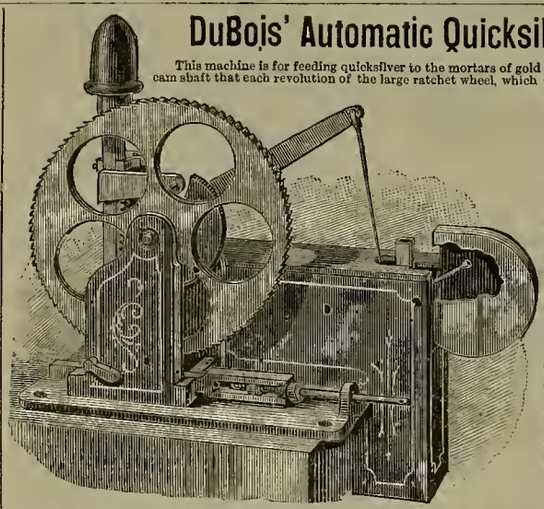
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.

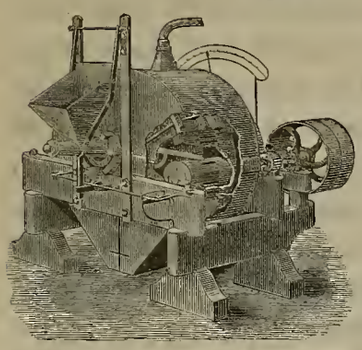
Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

TUSTIN'S ROTARY PULVERIZING MILL.



WORKS ORE WET OR DRY,

And Feeds Itself Automatically.

Patented October 11, 1881.

One of these machines can be seen at the Ore Sampling and Pulverizing works of Hofmann Bros., No 415 Mission St., where it is working every day. Weight 5,000 lbs., heaviest piece 480 lbs.

Manufactured at the

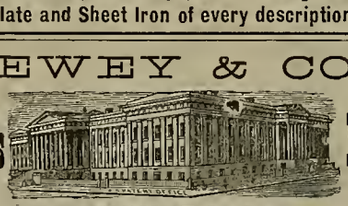
TUSTIN WINDMILL, HORSE POWER AND PUMPING MACHINE WORKS.

308 Mission Street, S. F., Cal.,

By W. I. TUSTIN, Inventor and Patentee.

DEWEY & CO.'S

Scientific Press Patent Agency.



[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

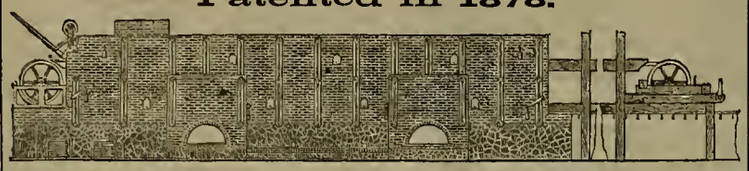
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteslan Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

THE O'HARRA CHLORIDIZING FURNACE.
Patented in 1878.


SIDE ELEVATION OF THE O'HARRA FURNACE.
This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.
BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.
An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.
A cheap Furnace to build and to run.
The process is essentially the same as the well-known Frsiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.
At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.
At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.
Lewis Chalmers, of the Isabella O. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.
SEND FOR DESCRIPTIVE CIRCULAR TO

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

TIRE UPSETTER.—Chas. W. Eames, assignor of one-third to Aaron Bell and E. F. Crocker, all of Shasta, Cal. Dated Dec. 6, 1881. No. 250,510. The improvement in tire upsetters consists in the arrangement of a stationary arm and a movable arm, and bed piece, the former having pivoted thereto a clamping jaw, and the latter having a similar jaw pivoted to and moving with it, said jaws having corrugated cam heads, and being so pivoted that when forced together the clamping power is in proportion to the power exerted. The operating device is a lever, which draws back and forces the movable arm toward the other. The advantage of this device lies in its simplicity and effectiveness. Great force can be exerted to press the lever down, and in proportion to that force, the clamping power of the jaws is increased.

LIFTING JACKS.—George Caseres, Freestone, Sonoma county, Cal. Dated Dec. 6, 1881. No. 250,497. This invention relates to certain improvements in that class of liftiog jacks which are used to lift the axles of wagons; and it consists in such a construction as will render it readily adjustable, dispensing with some of the usual bolts, nuts and guides, and generally simplifying the whole device, whereby it is rendered cheap and yet efficient.

CULTIVATOR.—A. Evans and J. Draper, St. John, Colusa county, Cal. No. 250,512. Dated Dec. 6, 1881. This invention relates to that class of agricultural implements known as cultivators, and is one comprising two series of diverging independent arms having their forward ends each pivoted at or about the center of the next preceding one, the front central arm having a shank extending forward and secured to the shaft upon which it has vertical play. The combination is one which is very strong and effective.

Mining Debris in Congress.

The California Congressmen seem to be alive to the great interests involved in the vexed question of what to do with the debris from the hydraulic mines, and are bringing the matter before Congress in a way that will call the attention of the country to it. Once in Congress, the slickens question becomes a national one, and it is taken out of the influence of local prejudice. While it may not then be argued with the same knowledge of facts which it would be within the bonndaries of the State where the evil exists, it will nevertheless be considered more calmly and with greater deliberation.

Mr. Page has already introduced a bill, in the preamble of which he sums up the question briefly, showing what the evils are, and also showing the great importance of the mining industry and the harm being done to the agricultural industry.

The concluding paragraphs of the bill are:

WHEREAS, It is believed that the settlement of the grave issues which have arisen in the State of California, in relation to the physical features of that State and the location of the mines, is peculiarly under the province of the General Government, which has reaped such vast benefits from the mining interests in that State to harmonize these interests, which it is confidently stated by our most able scientists and engineers can be done by the construction of proper works, at the expense of the General Government; therefore,

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That the sum of $500,000 be, and the same is hereby, appropriated out of any money in the Treasury not otherwise appropriated, for the purpose of making such improvements or works, under the direction and supervision of the Secretary of War, as he may see fit, for the improvement of the Sacramento, Yuba, Feather and American rivers, and their tributaries, so as to protect them from overflow from the debris and the filling up of said rivers, and for the removal of deposits of debris that now impede navigation, and also to prevent the destruction of lands and property adjacent to said rivers, and to protect the harbor of San Francisco from further injury from said cause.

Mr. Berry has also introduced a bill, setting forth briefly the facts in the case, concluding as follows:

WHEREAS, Lieutenant Colonel of Engineers G. H. Mendell, U. S. A., after a careful examination, in pursuance of the act of Congress directing such examination, has reported to the War Department recommending immediate action by the General Government in the construction of stone dams in river canyons, which is believed by eminent engineers to be the only feasible remedy to arrest millions of tons of debris now in the upper river channels, and in its way to the levels below; and

WHEREAS, It is the duty of the General Government to protect from injury and to improve the navigable waters of the country in the interest of commerce and the public welfare generally, and it is of vital interest to the commerce of the State of California that remedial measures be quickly taken to prevent these pressing dangers to her commercial interests, and to reclaim an almost desolated portion of her Territory, larger in extent than some of the States of the Union, and that it is highly important to the General Government to lend its aid in compassing the results sought by the State.

Therefore, be it enacted, etc., That a sum of $500,000 be, and the same is hereby, appropriated out of any money in the Treasury, not otherwise appropriated, to be expended under the direction of the War Department in such manner as shall be most efficacious in preserving the navigable waters of the State of California from injury by the deposits of debris from hydraulic mining, and said amount appropriated is hereby made immediately available.

A. W. SANBORN & Co., in this city, while being agents for the celebrated Mitchell farm and spring wagons, are also manufacturers and dealers in carriages, express and business wagons from their own manufactory in Manchester, N. H. This firm has a large assortment of first-class vehicles of various styles.

News in Brief.

COL. JOHN W. FORNEY died at Philadelphia this week.

THE smallpox excitement at New Tacoma, W. T., has about subsided.

THERE are 164 failnres reported in the United States dnring the past week.

THE diphtheria destroyed 2,000 lives in the province of Nova Scotia last year.

THE tenants on four large estates in Ireland have joined the no-rent movement.

FROM pew rents and other sonrces, Beecher's church has an income of $57,000 a year.

SMALL-POX is increasing in Chicago, and the people are flocking to he vaccinated.

SENATOR MILLER has introduced a hill to make the Tulare hig-tree grove a public park.

THE Trades Assemhly of S. F. protest against the employment of convict lahor in manufactnres.

STOCKTON wants three narrow-gauge railroads running out of that city—one to New Hope, one to Farmington, and one to Lockford.

DURING the week ending Dec. 10th, 395,480 standard dollars were put into circulation, against $485,496 for the corresponding week last year.

SERGEANT STEWART, of the Eighteenth Infantry, Fort Assinahoine, M. T., while on escort duly lately, had one hand and both feet frozen.

IT is annonnced that fierce competition in telegraphic commnnication with America and India may he looked for from the new company to he launched next month.

DETERMINED efforts are to he made in Congress to secure the forfeitnre of railroad lands in cases where the conditions of the law have not been complied with.

THE Madera Flume and Trading Co.'s mills, near Fresno flats, have cut over 11,000,000 ft. of lumher during the past season, of which ahont 4,000,000 ft. are still at the mills.

CREDITORS of Lord & Williams, of Tucson, Arizona, representing $39,000 have refused the proposition of H. B. Claffin & Co., to take the assets of the firm and pay 50% of the indehtedness.

THE hearing in relation to the contempt of five mining companies, defendant, in the snit of Marysville *vs.* The North Bloomfield Co. *et al.*, set for Saturday, has heen continued to the 22d inst.

LEVEE work is nearly complete along the Yuha river and around Sacramento, and it appears high enongh for protection. There is a hetter feeling of safety, and hnsiness is generally improving.

HON. B. B. REDDING, W. F. Good and I. D. Redding, of San Francisco; W. C. Belcher, of Marysville, and J. D. Crooks, of Tehama, are the directors of the new hank of Benicia.

THE old Whitehall gold mine, in Spottsylvania county, Va., has heen honght hy a company, among the members of which are Senators Call, of Florida, Jonas, of Lonisiana and others. Gold was first fonnd there in 1809. Nearly $2,000,000 worth of gold has heen taken from the mine.

Pacific Coast Weather for the Week.

The following is a summary of the rainfall for each day of the week ending Wednesday, Dec. 14th, at noon, for the stations named:

Quicksilver Feeder for Gold Mills.

When automatic ore feeders first came into use, no one believed in them. Everybody thought that it would be necessary to have a man with a shovel standing around to help the feeder; that machinery could not do the work as well as a man. It has been found by experience that automatic feeding is the best; that the machine not only does its work as well, but better than the man, and now all mills use automatic ore feeders because more ore can be put through in a given time with the same power than under the old system.

People nowsdays want to make machinery on pretty much everything, and they succeed very well. The latest thing in automatic mechanism for quartz mills is a quicksilver feeder, the invention of Mr. P. C. Du Bois, of this city. Messrs Whitney & Marsball, 22 and 24 Fremont St., sole agents. We illustrate this device on this page.

This machine is for feeding quicksilver to the mortars of *gold mills*. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and, by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortars. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it

DuBOIS' AUTOMATIC QUICKSILVER FEEDER.

allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from one to four minutes. As the gold goes in, and also out of the mortars continuously, it is necessary, in order to effect the best amalgamation, that the quicksilver should go in continuously.

The second point of excellence is, that it renders the feeding of quicksilver practically perfect, as to regularity. A superintendent can adjust the feed to suit the ore being worked, and feel certain that a regular, uninterrupted feed will be kept up during his absence, which is impossible to attain under the general method of hand feeding. It places the feeding of a quantity of quicksilver proper for taking up *all* the gold in the ore, under the control and knowledge of the superintendent alone, and that, with but a few moments of his attention each day.

The reservoir of the machine holds 25 lbs. of mercury—a quantity sufficient for some weeks' work. A lid fastening on top of the tank keeps all secure. The cup which throws out the mercury can be replaced by a larger or smaller one, as the ore requires more or less mercury; several sizes of cups go with each machine. The frequency of feed is regulated by turning a nut, which controls the thrust of the bar that drives the ratchet wheel; thus making the ratchet pass either one, two, three or four teeth space, at every revolution of the cam shaft.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

ANNUAL STATISTICIAN of 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 816 California st. Price, $4

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—San Mateo and Santa Clara counties.

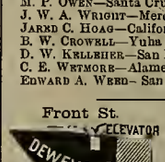
EDWARD A. WEED—San Francisco.



Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman, and the Fraternal Record, are now favorably situated at No. 252 Market St. Elevator entrance, *No. 12 Front St., S. F.*

The Californian.

Back Volumes and Single Numbers for Sale.

Copies of the above Magazine can be had in single Nos. or Vols, (bound or unbound) from No. 1, Jan., 1880, to July 1, 1881. Price, 35 cts. for single copies; $1.50 per volume; bound volumes, $2.25 "A handsome California gift." Prices reduced to the trade for large orders. Address this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

BOOKSELLERS, STATIONERS, ETC.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and stationery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their first quality of blank book and fine stationery line of goods.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
Press, Box 2361, S. F.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

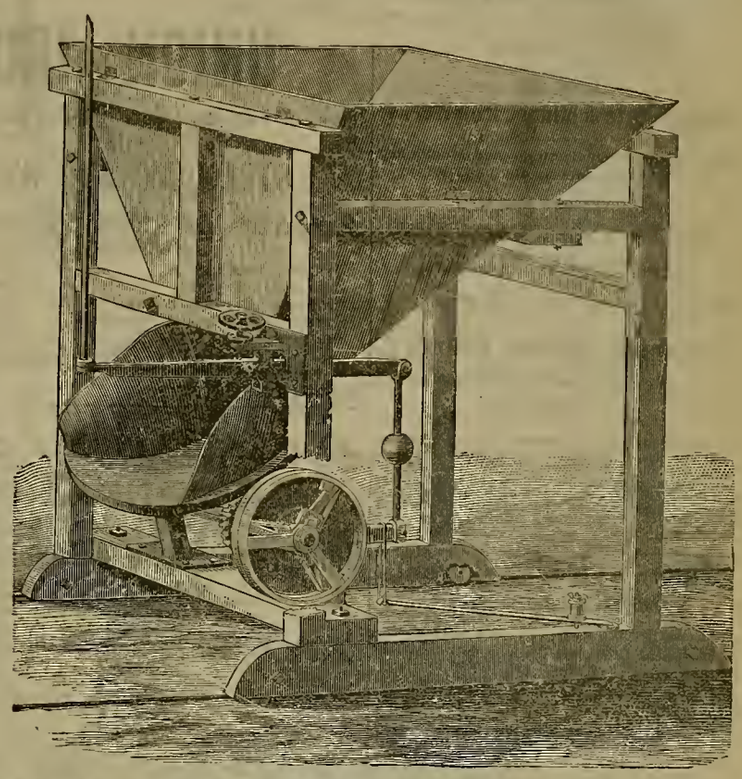
OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.



The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

Good Land and Sure Crops.

There has been steady and tolerably rapid advancement made in the growth of a majority of the towns in Colusa, Butte, Tehama and Shasta counties. Especially is this so in the agricultural districts where the land produces at least fair crops in all seasons—wet or dry—as does the land on the Reading Ranch. Those looking for homes in California where diversified farming will pay every year; where wood and water are plenty and easy to be obtained, and other desirable advantages are to be had, should address the proprietor of the Reading Grant.

Some 14,000 out of 26,000 acres of the grant remain for sale at comparatively low rates, in quantities to suit purchasers, on easy terms. Prices range from $5 to $30 per acre. The tract is between two and three miles wide, with the Northern Division of the C. P. R. R. passing centrally through its entire length. Send postage stamp for free circulars containing information about Shasta County and these lands, to the proprietor of Reading Ranch. EDWARD FRISBIE,

Anderson, Shasta County, Cal.

143 Frsmont St., - - San Francisco

San Francisco Pioneer Screen Works
J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.
32 Fremont Strsst, San Francisco.

Diamond Drill Co.
The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

VOLUME XLIII Number 26

Prejudice Against Mining Machinery.

In all hranches of mechanical indnetry the workmen reeent the introduction of machinery whioh ie to take the place of their hand lahor, and they seem to do this even if it ie ehown to he of ultimate benefit to their class. This ie, of conree, at firet, for in tbe end the machinery, if at all economical, is bound to work its way into use. When machine drille were first ueed there wae a great howl against them and we all know what a hard fight it was to get Giant powder into tbe minee, and how hard the men worked againet it. In fact, no improvements are ever looked upon with great favor at firet hy the class which ie to use them.

A case in point is that of the coal cutting mechinee in Eogland. Theee and other applianoee which have heen introduced for the economical and eafe working of collieriee have not heen received with that enthusiasm that wae to have been expected. Experience has ehown that tbe machinee already in operation have not only nnder cut coal far more expeditiouely and economically, hut with greater eafety than it could poesihly he done hy hand. The machinee, with ecarce an exception, have turned out eucceefnl eo fer as the cutting of coal ie concerned, but the reason of their non-uee ie given hy the London *Mining Journal* ee the indieposition on the part of the minere to allow them a fair trial.

Pick machinee are now at work in eeveral places, and donhle pick, elottere and rotary machinee ae well; and, in fact, it ie now over 20 yeare eince the firet coal cutter was tried. A number of machinee have heen tested at collieriee, and have done good work, effecting in a certain time ae much work ae eome 12 or 15 good colliere.

Lindeay Wood, one of the commieeionere on accidente in coal minee, a large colliery owner in the nortb of England, and who has paid ae mnch attention to coel-cutting machinee ae prohahly any man, in hie evidence hefore the eelect committee on coal, etated that in one of the collieries with which he wae connected he had two coal-cutting machines working for ahout 10 years, and althongh in the firet ineetance the effect had not heen to reduce the amonnt of manual lahor to any appreciahle extent, yet it had the effect of producing more round coal per ton wrought, and coneequently was a commercial enccess, although it did not reduce the amonnt of manual lahor. The eeam, however, could not he worked longwall, which was a great drawhack. Mr. Firth'e machine was aleo tried hy Mr. Wood, and he helieved that machinery wonld do the work, and relieve the men of the oppreesive lahor of cutting hard coal. Mr. Dickineon, the Chief Inepector of Minee, on the same occaeion in his evidence, eaid he had eeen several machinee at work, and the maker of one of them—Wenstanley'e—had at the time as many ordere for them as he could execute, and he helieved they would continue to increaee.

The machinee are worked by compreesed air, and the exhauet air coole tne working places. In addition, there ie increaeed output, and the comparative eaee with which coal can he worked at great depths ee compared with mannal lahor in euch hard work ae cutting coel in a heated atmoephere. Yet, notwithstanding all thie, these machines are not used.

THE LATEST "ISTHMUS" CANAL PROJECT is for an opening through the northern portion of the Malayan peninenla, which etretchee eouthward into the Indian ocean a dietance of 500 milee. Thie canal will he aeeieted hy a natural waterway wherehy the distance from the western to the eaetern ehore is narrowed down to only 30 miles of cutting. With euch a canal the dietance from eouthern Aeia to China would he reduced hy ahout 600 milee. The London *Times*, in approving of the project, eaye that the engineering difficultiee are not of a very difficult character, while the political drawhacke are *nil*. Thie project ie certain to he accomplished eooner or later, and the preeent eeeme to be a favorahle time to effect thie important improvement in the navigation of one of the principal ocean rontes of the world.

Water for Blasting.

Now tbat blasting will bave to hs diecontinued in eo many "fiery" coal minee in Great Britain, the best snhetitute will he nscesearily looked for, and it is euppoeed to have already heen fonnd in water. There could hardly he found two more oppoeite things to accomplieh the eame purpoee than fire and water. Of couree, the powder ie mnch more expeditioue and effective and will he used where allowed, hut in the dangeroue minee where there ie eo much chance of loee of life the water method will, no douht, eerve the purpose well.

Sir George Elliot, in his evidence hefore the Select Committee on Coal, eaid he did not look eo much to the coal-cutting machine aeto that which wae invented by Mr. Bidder and Mr. Chuhh, which, he helieved, would have to he used, hecauee it could he eucceefully ueed ae a euhstitute for gunpowder and hlasting. He further etated: "I have eeveral of them in nee whenever gunpowder hlasting ie necessary; and where hlasting cannot be done with eafety, theee inetrnmente are need in the place of gunpowder, and they answer moet effectnally. Inetead of putting a ehot to hlow out your coal, yon pnt in an instrument which yon expand hy hydranlic preeeure until it hurets the coal out."

This etatement, coming from the highest coal-mining authority, would eeem to prove that there is a good snhetitute for powder availahle. In hlaeting with powder there ie danger to he apprehended from eeveral qnarters, and mies shote are hy no means nnfrequent, either from imperfect drilling or through the ineufficiency of the powder. But it appears that miee ehots are effectually prevented by McDermott'e drill.

Mica Masks for Furnace-Men and Others.

A well-known Germen manufacturer of mica waree, Herr Raphael of Breslau, now makes mica maske for the face, whioh are quite traneperent, very light, and affected neither hy heat nor hy acide. They afford good protection to all workmen who are liahle to he injured by heat, duet or noxioue vapore, all workers with firs, metal and glass meltere, etonemaeone, etc. In all kinde of grinding and polishing work the flying fragmente rehound from the arched mica plates of the mask without injuring them. These platee are fixed in a metallic frame, which ie well ieolated hy meane of aeheetoe, eo ae not to he attacked hy beat or acid. Theee maske allow the turning of the eyee in any direction, and, as egainst mica spectaclee, they afford the advantage of protection to the whole face. In certain caeee, the neck and shouldere may aleo he guarded hy a sheet of cloth impregnated with fire-proof material, or by aeheetos eheet, attached to the mask.

The interval hetween the mica and the eyee allowe of workmen who have poor eyeeight wearing epectacles, and of workere with fire or in melting operations wearing colored-glaee epectaclee under the mask, without fear of hreakage of the glass, mica heing ench a had condnctor of heat. Where the mask hae to he worn long it ie found desirahle to add a caoutchouc tuhe with mouth-piece for admieeion of freeh air; the tuhe pasees out to the ehouldere, where its funnel-ehaped end (sometimee holding a moietened eponge) ie enpported. The mask hae a eort of cap attached to it for fixture on the head.

THE PALMER SAFETY CLUTCH FOR ELEVATORS.

A New Safety Clutch.

The Palmer eafety clutch for elevatore, which ie ehown in the engraving on this page, is the lateet device in that line, and ie one of the simpleet and moet effective. The clutchee proper are atteched to a pair of hare under the platform, hut entirely independent of it. Theee bars, cerrying the clutchee, are halanced by a weight, the rope of which goee over a eister pulley on the elevator pulley shaft. All the weight the supplemental rope has to carry is that of the hars and dogs.

The epringe shown, keep the doge away during the natnral travel of the elevator.

The skeleton platform, (that is, the hsre) carrying the clutch will rise and fall with the elevator, and yet be independent of it. If now the rope-carrying elevator ehould break and the elevator drop, it will only drop an inch or two, and will then strike the dogs of the clutch, theee holding the ekeleton lower platform and preventing further deecent. Thie action ie inetantaneoue and positive, no spring, weighte or anything heing reqnired. The cage ie caught hefore any momentum ie given it. The platform hare underneath eupport all the weight on the elevator, the qnicker the catch and lighter the fall. The dogs jam toward each other, one pair on each eide, and do not, therefore, tend to epread the guides, as moet clutchee do. The cage ie canght inetantly.

Overhead is an automatic hall governor attachment eo that in caee the elevator ehonld etart hy the run of exceeding a certain speed, an ingenioue yet eimple arrangement tripe the rope connecting it with the clntch, holding the clntch and letting the platform come down on the dogs and etop.

One of these elevatore was put up in the U. S. Quartermastere' huilding, in thie city, jnst after the close of the Mechanice' fair, where it wae exhihited. It was overloaded one day after a month or eo, some 2,500 lbe. heing put on. When they opened the valve to raiee it, the thing etarted down on the run. The ball governor action tripped the clntch and the fall wae only 18 inches from the level of the floor. No damage, however elight, wae done.

One of theee clutchee has heen lately put in the Grand hotel, after the opinione of a number of experts hed been taken, and various olutchee examined. In thie there is a conductor rod, eo the hoy can throw the clutch into action at any time, if he desires. It acte aleo automatically, of couree. There is no circumetance nnder which thie can hreak that it cannot he caught. As will he eeen hy the engraving, the device ie qnite eimple. The doge travel np and down all the time, hut in caee anything breaks the platform drope on them, and they jam into the wood and catch the load. In addition to thoee mentioned, theee clutches are on eeveral other elevatore in this city. Mr. C. C. Palmer, the inventor, hae an office at No. 303 Montgomery street, where further information may he had.

THERE ie an artesian well in the Bay of San Francisco. It is ahout two miles from the Alameda shore, oppoeite Newark, at a houee on the oyster hede of Doane & Co. This houee ie on a platform eet upon pilee. The well ie 212 ft. deep, with an outeide pipe of eight inchee and one of eix inches on the ineide. A filling of cement prevente leaking and eaves the inner pipe from salt water. The water ie good. These oyeter hede cover a large area, are located in Alameda, Santa Clara and San Mateo countiee, and are planted with Eeetern oyetere.

THE Moulton Co. hae furnished Butte with an excellent quality of water, and now propoee giving that great mining camp power for eiectric light. The company has introduced the light in the hoisting works, and the mill will soon he supplied.

LARGE SHIPMENT OF QUICKSILVER.—Four tone of qnicksilver reached Helena, Montana, the other day from the terminne. It ie for the nee of the Alta Montana Co., at Wickee.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Winters at Galena and Sawtooth, Idaho.

Editors Press:—Referring to your issue of Nov. 12th, we notice en article clipped from the Eureka *Sentinel*, which states that it takes two summers to get macbinery for a 20-stemp mill into Sewtooth, I. T.

We regret that the correspondent of the *Sentinel* should hazard expressions on a subject which he seemingly knows so little about, and would inquire of him why it should take two summers to put up a mill at Sewtooth, more than any other place?

The country surrounding Galena and Sewtooth too long has suffered from gross misrepresentations, and it is the purpose of this article to correct the many wrong impressions regarding its accessibility from Mey to Jenuary, so industriously circulated hy *all* the papers of the lower towns of Wood River, from which outside papers so frequently take their cne. The facts of the case are these: On the first of July last, Sawtooth, then only a town in name, was separated from Galena and the entire outside world hy a high and impassable mountein range, 12,900 ft. above the level of the sea in its lowest available pass, and utterably impesseble except for the snre-footed mule.

Before the first of November a splendid wagon road had long since been completed, a sew mill, two shingle mills, and all the mechinery for a heavy stamp mill, with the latest improvements, was in place; two immense lime kilns were in active operation, and Sawtooth had grown to be e town of importence.

Not being familiar with the different pheses of climete here, on the first eppearence of a little snow, the manegement of the different mines put them all upon a winter besis, and left them until spring. Snow, however, has not, as yet, fallen to e greeter depth than 18 inches on the line of roed, and teaming from Ketchum has been going on uninterruptedly.

The stage sleigh which cerries the mail makes the time between Ketchum and Sawtooth, 45 miles, in eight hours, and the contractor antioipates no difficulty in keeping the road open all winter. J. E. C.

Gelena, Wood River, Idabo, Dec. 10.

The St. John Del Rey Mine.

Editors Press:—As the matter of the treatment of auriferous pyrites at the St. John Del Rey mine in Brazil, by amelgametion in the raw state in harrels, hes been again referred to in an interesting article in your columns, it may not be impertinent tostate the following circumstancs:

Some time ago I was consulted by Mr. C. G. Nelson as to the advisability of introducing the chlorinetion process in the treetment of sulphurets from the above named mine, as the process then in use gave a result of not more then 60 per cent of the assay velue, "reports printed and published in London," notwithstanding. Considering the locelity, and the low grade of materiel operated on, I did not venture to advise the adoption of chlorinetion immediately, but suggested a series of experiments on a moderate scale of magnitude. What course was pursued I know not, but Mr. Nelson hes recently assured me that the use of berrel amalgametion has been discontinued. Mr. Nelson was acting on bshalf of an English gentleman who ceme here from Brazil, where he had been investigating the affairs of the mine.

C. H. A.

The Providence Mine.—During the pest two weeks the mill at the Providence mine hes beeu shut down in order to bring in more weter, the amount furnished hy the Excelsior Water Co. not being sufficient to run the boisting works and the large 40-stamp mill. The owners of the Providence having mede arrangements with the South Yuba Water & M. Co. for supply of water from the snow mountein ditch, have erected a suspension bridge across Deer creek, below the Merrifield mine, and have hed 1,600 ft. of 22-inch iron pipe constructed, for the purpose of conveying water to the mill and hoisting works. This will give a pressure of 400 ft. and afford water enough to run 500 stamps, if necessary. The work is about completed, and the water will he turned on in a day or two, when the powerfnl machinery will he set in motion and the crushing of qnertz renewed. Dnring the two or three weeks occupied in making these changes, the mine hes been shut down, owing to the accumulation of ore upon the dumps end in the stopss. A large nnmher of miners have been consequently without employment during the time, but they will probably go to work again next week, and it is generally understood that there will he work for a number more of miners, as the mill can now bs run to its full capaoity.—*Nevada Transcript.*

Precautionary signals on our Northern lakes have redneed the numher of disasters to vessels from 207 in 1869, to 91 in 1879, and tbe losees from $1,560,000 in the former year to $455,205 in the latter year. We need the same eystem on this coast.

Mining Debris Question in Congress.

Bills Introduced by California Congressmen.

Congressmen Page has introduced in the Honse of Representatives the following self-explanatory hill on the subject of mining debris:

Whereas, A contest exists in the courts of the Stete of California, hetween a portion of the egricnltnral community and the mining industry of that State, by reeson of the assertion by the miners of the right to work their mines by hydraulic and other processes, which have heen continuonsly in use since the discovery of precious metels on the Pacific coest, which rights and use have been senctioned hy lews and common nsage during the past 30 years or more; and

Whereas, These rights and common cns-toms are not disputed by the owners of lands in the velleys helow the mines, a large amount of which have been injured hy the deposit of tailings or debris from the mines; and

Whereas, A large portion of the agricultnrel lends in the Stete are in danger of destruction from the results of the said hydreulic mining, and towns and cities on the banks of tbe streams affected by the debris ere being destroyed; and

Whereas, The agricultnral interests of California—the first wheat-producing State of the Union—es well as the labor of onr farmers, ere heing destroyed by debris covering np their fields, gardens and homes; and

Whereas, The resnlts of 30 years' toil are thus imperilled, and families and commnnities threetened with impoverishment; and

Whereas, The harhor of San Francisco is being shoaled hy the deposits of mining debris, and it is only a question of time when serious consequences therefrom may impede the national commerce of that important harbor; and

Whereas, The Stste of Californie asserts the right to control the rivers of the State under the plea that mining operations are damaging them; and

Whereas, One or two of the counties of the State and one of the incorporated towns have also asserted rights hostile to the mining industry; and

A Syetem of Public Works.

Whereas, The Stats of Calhfornie, througb its Legisleture, some two years since, enected a law to "provide dreinage," heving for its object to cure the evils compleined of; and

Whereas, The Supreme Court of the State has recently decided that the Stete hed no such power, thns leaving the oontest between the conflicting interests to continue; end

Whereas, This contest which is now pending in the State and Federel Conrts, involving vast interests, will continue unless remedial measures are teken by the General Government, which can alone grapple with these issues hy instituting a system of onblic works; and

Whereas, The present contest, if continued, will lead to serious results, prejudicial in meny ways to the hest interests of the nation et large; and

Whereas, The Congress of the United States bas by verious enectments, extending through a long series of years, encouraged and fostered the mining industry by the reservation of its mineral lands from sele, except for mining purposes, and also by specially providing for the protection of all weter-rights, reservoirs and the rights of way for canals for water nsed in the nines, as well es for the use of timber upon the public lands for the seme purpose, and hes also charged the miners donhle the price for mineral lands that it has charged the agriculturists for farming lands; and

Whereas, By reason of such encouragement and fostering influence, the mining industry on the Pacific coest has attained enormous proportions, in which industry our citizens have invested their meens to the extent of at least two hundred million dollars, which investment is in jeopardy, and is at present seriously embarrassed by legal complicetions; and

Whereas, Through this mining industry in California alone not less than twelve hundred millions of dollars in gold have heen extracted from the earth, which susteined the nation in its time of trouble, es well as influenced for our benefit all financial, commercial and other pursuits and industries; and

The Value of the Gold Depoeits.

Whereas, The largest known gold deposit in the world, estimated to contein at least $3,000,000,000, is contained in the auriferous gravel channel in the Stete of Californis, which can only be extracted hy the modes and usages in operation during the past 30 years, and out of which is taken yearly at least $13,000,000 ont of a total yeerly gold product of $19,000,000; and

Whereas, This yearly product will continue for the next 100 years or more, if this gold-producing interest is properly protected and cared for by the General Government, but which is now seriously embarrassed by conflicting interests; and

Whereas, It is believed that a proper system of engineering works (not expensive when the vast interests at stake are considered) can he constructed by the General Government without injury to any interests, but with benefit to all, hy which the mines can continue to be worked without detriment to the agricultnral interests, and thus keep up the yearly supply of gold, so essential to our prosperity; and

Whereas, The known gold area which will pay to mine by any known process is qnite limited, and the agricultnral area prectically unlimited; and

Whereas, The policy of our Government is now, and has been, to protect and foster in all ways, the production of the precious metals and the mining industries connected therewith; and

Whereas, It is helieved that e settlement of the grave issnes which have arisen in the Stete of California in reletion to the physical features of that State and the locetion of the mines is pecnliarly under the province of the Generel Government which hes reaped such vast bsnefits from the minlng interests in that State, and to hermonize these interests, which it is confidently steted by onr most able scientists and engineers, can be done by the constrnction of proper works at the expense of tbe Government; therefore,

Be it enected by the Snate and House of Representetives of the United States of America in Congress essembled, that the sum of $500,000 be and the same is hereby appropriated out of any money in the Treasury not otherwise appropriated, for the pnrpose of making such improvements or works under the direction and supervision of tbe Secretary of Wer as he may see fit for the improvement of the Sacramento, Ynba, Feather and American rivers and their tribntaries, so as to protect them from overflow from the debris end the filling up of the said rivers, end for the removal of the deposits of debris that now impede navigation, and also to prevent the destrnction of lands and property adjacent to the said rivers and to protect the harbor of Sen Francisco from further injury from tbe said cense.

Singular Change in a Mine.

Water Disappearing Without the Aid of Machinery.

Mining men who are familier with the workings of Esmeralda mining district for the past four years will remember the trouhle the Real Del Monte Co. had with water struck in their mine on the 500 level. Very shortly after striking it they were compelled to stop operations until they could get a lerger pump and heevier machinery—the weter rising to or ehove the 300 level, and remaining there until some time after they got the new pump in operation, it being qnite a struggle to lower it to the 500 station. They finally succeeded in draining the shaft and sinking it ahout 300 ft. more, when the foundation of the pumping engine or boh, began to give away, and they could not run the engine fast enough to keep ths water out, and were compslled to stop operations until they could make arrangements to put in a new, substantial foundation. As soon as the pump stopped the water commenced rising, and continned until it was np to the 300 level again, where it remained for severel months. But lately, seys the Esmerelda *Herald*, end to the snrprise of the people interested in the famous old district, the water commenced lowering, without the aid of any machinery, end continued gradually until it is now down to the 500 stetion. What hes caused this greet change? Is it not plain to any person acquainted with the neture of mountain springs, that they invariehly begin to send forth a greater volume of water about the month of Sept., no matter whethsr we have any rain or not? This heing the case, can there be any other theory advanced than that the great flow of water forced up into this shaft, which answered the seme purpose for the wster of this hasin that artesian wells do for other hasins, has found auother channel hy which it is permitted to escape. This cannot he otherwise than the true theory, as the hulk of the water was forced up into the 500 drift until they cnt the seme channel lower down. There was no water coming in at that drift, hut as soon as the pump would stop it would rise above it in a very few hours. W. P. McIntosh says he knew of just such another inoident connected with a mine which he was working, but on a much smeller scale. While sinking a sheft, when the only machinery they had consisted of a hend windlass, with a 20-gallon hsrrel attached to it, the flow of water got so strong that they were compslled to put on three shifts of men, in order to make eny heedway at all, and finally had to ahandon it entirely for some time. Some time afterward they had to clear the shaft of weter, when it was discovered that there was no weter coming in, and they were enahled to continue the work of sinking for a considereble distance farther. It is good news to the people who have so much feith in the mines of this district, and particularly to the Real Del Monte Co., who have already expended so meny thonssnds toward prospecting that portion of it; but as they attained a deptb of ahont 800 ft., and their prospect for a bonanza became more flattering, heing compelled to suspend operations for a time mnst have been anything but a pleasant thing to do. That obstacle heing out of the way, we look forward with pleasure to the time in the near future when we will again hear the wbistle on that hill as reguler as usual, and see the miners busily engaged drifting toward the Jnnietta, where all experienced miners say their great ore body lies.

Regular passenger trains are now rnnning over the Utah and Northern railroad from Ogden, Utah, to Butte, Montana. This railroad ought to do a great deal for the development of Montana, which is a rich and extensive mineral region. Lack of cheap and rapid communication hae heretofore heen the greatest drawback to the progress of the Territory.

Christmas Chimes.

Hail, blessed day! Hail, Christlike morn!
So fill'd with joy, so bright with love!
Thou bringest tidings which were borne,
By angel's voice, from heaven above
To earth beneath, to men below,
In years gone by—tbe long ago.

We hail tbee now, witb bearts that thrill,
And softly list to tidings sweet.
Ring, Christmas bells, a merry trill—
Come angel-voice, kind friends to greet.
Soft Christmas cbimes, a Christlike deed,
Are tidings sweet—a Christmas need.

Swift in tbe footsteps of the beantiful feet of morning, and sometimes "preventing tbe dawn," will go the tripping troops of merry wisbes around the world in tbis gled Christmes time. How came the earth to be helted with this beautiful custom? Who geve to nniversel childhood this happy holiday? Our Christmas carols tell us: "Unto us a child is born." And "tbe government shall be upon His shonlder." And His neme shall be "the Mighty God." Give Him larger welcome and more room, O psople! Homes are happier, hearts are cheerier, lives are cleanlier, hnsiness is harvester, nations are peacefnller, women is holier, and childhood is heevenlier where He is. May all the air be thick witb melodions song. Room for the gift of God.

Christmas! the birthday of the whole world's Savior! I love to tbink of it for what it is—the one glad supreme holidey of the hnman race. Let there be langhter now, and joyous chimes, and games, love-tokens, and the greetings of dear hearts. Who would not take, once in the yeer, a psrfect reprieve from the eches of life, the sedness of a disenchanted heart, the fret and the turmoil of ambition and zeel and douht and wrath! This day means the real presence of the Divine among ns, a new morel force horn for a rece whose moral force was almost gone, a new departure for mankind, and quite properly and logically the heginning of a new mode of connting the world's years. Oh! if we could all fully know just why this is so happy a day as our happy customs try to make it, there wonld be no more sorrow possible here forever.

Whatever tends to make home worthy of the heart's deepest regerd, helps to compose the hest shepe of human welfere. The homes of the peasentry of France have again end egein come hetween that nation end ruin. Ont of those cotteges have come, in hours of need, men, money, and morals. Christmas is an annal exeltation of the fireside. It is not for man as a statesmen, nor as a scholar or soldier, but for man es a being who sits by a fireside, and eats at a table elong with loved ones. Each Christmss should make the crusty old bechelors, and those who imitete riches by boarding in palace hotels, blush with repentence, and abendon their narrow shepe of existence. It is to be hoped that ell the papers and speakers and all the fethers and mother, will so enlerge and glorify this Decembsr feast thet at last it will hecome the chief end of men to be the owner or the occnpant of a home.

Excess is so natural to men that a "merry Christmas" may easily mean indulgences that overtop the symmetry of strength, end to come toppling down on themselves like too ambitious erchitecture. None the less, it may he well to hold to the greeting, "A Merry Christmas," for the Christ-like spirit is one which reeches the hounds of pleasure without ever passing them—is the grape full of juices, yet that does not burst the skin, and so sour in fermentation.

What seems to he the greatest need of our times is not so mnch an increase of wealth in our country, for the people generally heve plenty, but rather do we need some way of enjoying more what we already have. We need not enlargement of our dominions, but consolidation and unity among our many-tongued and widely different popnlation. Among the many possible egencies in bringing about these results, we shonld not overlook the observence of our great national and religious holideys. In these we forget our lines of perties and sects, and come more fully into the life of Americens and of our common Christianity—into the broader love of man as man. In these public rejoicings we forget, for the time at least, our caree and onr deily toil. The interchenges of friendships and gifts make us richer in feeling at least, if not in fact; end, after all, it is the good feeling and good will thet give to life its real wealth and its sweetest charms. We need es a people more holidays, more days of rest and rejoicing; less of striving and worrying to acquire, and more ahility to enjoy whet we have. All hail, then, to Christmas day, with its merry greetings, its joy in the home, its gifts to the yonng snd the old, its love, its hope.

The children's day, the parents' day, the home day, whose nameless power makes truce with toil, conquers and brings hack the bnsiest and most distant ones to the hand-clasping end song-singing and story-telling around the old fireside, as in the deys of yore. Day, es well, it is which opens hearts and hends, promotes the humanities, and makes somewhat real the sentiment of a common hrotherhood.

The Centennial company, Siskiyou county, have found exceedingly rich pay in the hillside of their claim, which pays extravagantly, and seems to he on a hench of rock about six ft. highei than further out in the pit under the river wingdammed.

The Bald Mountain Exteusion Co., of Forest City, Sierra county, has cleaned np within a few days 179 ozs., valued at $3,322.

MECHANICAL PROGRESS.

Another Curious Experiment.

Gath, in ths Cincinnati *Inquirer*, says: "Yesterday a friend of mine took me to see a wonderful sbip or steamboat on the Harlem river, big enough to gst on it and take a ride, which I did. It is oalled the huoyant propeller, and consists of a steamboat 15 or 20 ft. long, propelled on globes of air. As you draw near you see three large yellowish globes, made of sheet iron, revolving on an axle like any other wheel. Tbere are little flanges' protruding from tbe globes, which are also paddle wheels. An engins on the deck makes these two axles revolve, the front axle having only one globe wheel on it, and the rear axle having two. As they revolve any leakage into the wheel is discharged at the axle. Consequently they can never fill. The present sbip moves on globes only six ft. in diameter, but the new ship is tn be built on enormous globes. The theory is that such a vessel will make from 20 to 40 milcs an hour, and an arc being presented at every point, thsre will be no slippags. I suppose the idea of this machino is tsken from the spheres on which we live that go through the air quickly.

Still Another—A Steamboat Wagon.

Great astonishment was created recsntly among the inhabitsnts of the Twenty-fourth Ward of New York, hy their sceing an extraordinary-looking vehicle with thrsc whesls, weighing over twn tons, steam its way across land from the Harlem river to Spuyten Duyvel creek, near tbe Hudson river, and traveling to tbe water's edge, not stop, hut continue on over the surfacs of the water as readily and almost as rapidly as it had traveled down hill on land. It was the "R. M. Fryer," s newly-devised ship or water-carriage.

The principle on which it is constructed is entirely a new ons, and cannot he more briefly described than hy ssying that it travels over the water instead of through it. As mnch difference is claimed by its inventor to exist hetween it and an ordinary boat as between a wagon mounted on wheels snd one that should rest on the ground and hs dragged along the surface hy means of wheels attached to its sides. The new hoat which is merely a model of a large one now in course of construction at Hestings, consists of a deck supported hy a framework resting on the axes of three hollow glohee. The globes being turned hy steam power, serve at once as the wheels of the marine carriage and as huoys, which keep the deck always above the water.

The boet is not intended for uss as a land carriage, hut one of the advantages it possessss is the power to travel over sand hare, or to hack off from a sandy shore without externel appliance. The absence of friction, mr reover, attained hy placing the boat ahove the water instead of in it, will enable the huilder, he claims, to ohtein a far greater rate of speed than is possihle to any hoat floating in the water. So far as the trip across land is concsrned, there is no doubt, from the demonstration ahove described, that a ship can he made to travel without any water to float in. For the more complete demonstration of some other points the inventor ie compelled to wait for the completion of the lerger vessel he is building, which is to travel on three globes of 24 ft. diameter.

BOILER CAPACITY VS. HEATING SURFACE.—A correspondent of the Boston *Journal of Commerce* calls attention to some experiments made at the Forest river lead mills in 1861 which sue tain the position taken that extent of heating surface, as ordinarily calculated, does not always increase the hoiler capecity. The following shows the resnlt of the experiments: Four 12 inch diameter tubes were set as follows:

15 Ft.	5 Ft.	5 Ft.	5 Ft.
.....	.....	.....	.....
.....	.....	.....	.....

The first over the fire was 15 ft., grates 3 ft. long. The other tuhes were eacb 5 ft. long. Water hoiled in the first tube in forty minutes (210°); at the sems time the thermometer indicated 110° in the second tuhe, 100 in the third, and 90 in the fourth. The temperature in the second and third tuhes, after the water hoiled in the first tuhe, increased 1° a minute; the fonrth less. When the water in the second tuhs was 180°, the third was 170, and the fourth was 140. When the water hoiled in the second tuhs the thermometer indicated 190°, and 140 in the fourth. The water was nne hour and forty minutee longer hoiling in the second tuhe than it wes in the first. This would indicate that long hoilers have not the same espacity in proportion to extent of heating surface as shorter ones.

ENGLISH APPRECIATION OF AMERICAN MECHANICS.—The London *Iron* says: There are meny articles in the production of which greater taste might he cultivated to much advantage, a matter in which, as a nation, we have never excelled, and in respect of which severel foreign countriee are a long way ahead of us. An example which will readily present itself to many minds is to he found in the superiority of the tools which are now so largely imported into this country from America, and which, while remarkahle for their quality and finish, are much less costly than those of Euglish produotion.

Schools to Train Mechanics.

The Philadelphia *Ledger* says: Commissioner Elliot C. Jswett's roport on the manual training school nf Europe, whose prodncts were exhibited at the Paris exhibition of 1878, shows that Russia and France are giving ths most attention to this subject. The technological schools of Russia receive most liberal support from the government, and are msnaged very mnch like military schools, only that tbe pupils learn to hecome civil or mechanical engineers, or skilled workmen and foremen in constrnction shops. Russia has also technical schools and workshops less ambitious than thoss at St. Petersburg, where pupils psy nominal fees for instruction, ahont $15 per annum for tbose who do not board at the institutions. The pupils attend school for fonr and a half hours per day, and work five hours. All of these schools are well equipped with machinery, the instruction appsars to he thorough, and gradnates find no difficulty in obtaining situations as forcmen of other workshops.

Ths Frenoh schools, like those of Worcester, Mass., manufactnre articles for sele, and those of Switzerland are devoted, almost excluoively, to watchmsking. Austria has 80 schools for industrial training, with about 4,000 pupils, but no information is given as to how they are managed. In some of these schools instruction is given at night, ths pupils hsing employed at other work dnring the day. This is the nearest approsch in any of the foreign schools to the experiment in indnstrial training now heing tried hy the Spring Garden Institute of this city. For two years instruction has been given in filing to small classes, with snch good results that this year a complete machine shop, on a small scale, is to he opened, and instruction given to a larger class of pupils in every hranch, except casting, of mechanical work in metals, and possihly in wood. It is not supposed that such schools can take the place of the workshop for training mechanics, but that, under present conditions of doing work mainly hy machine tools, the apprentice attending the school can more readily acquire skill in the handling of tools and a hroad general knowledge of me chanical operations.

A NEW GAS ENGINE.—The popularity of the gas engine, great as it undouhtedly is already, will he much extended hy the introduction of an engine now heing manufactured under Hutchinson's patent by the London Gas Engine Co. The design and arrangements are quite new and original. An oval-shaped iron casting of considerahle thickness, cast in one piece with the cylinder, conceals the piston rod, connecting rod and crank from view, and while imparting to the engine great firmness and steadiness, prevents the risk of accident. Regularity in working is also attained hy the employmeut of a specially heavy fly-wheel. All parts of the "London" engine are constructed to gange, and are therefore interchangeahle and easy of adjustment. The working parts are few in nnmher, and are made of hardened steel, so as to secure the utmost durahility and smoothness of motion. The consumption of gas is low, and can he regulated with great nicety, according to the load on the engine. Coal, petroleum, atmospheric or water gas can he used equally well. A turn or two of the fly-wheel hy hand will set the engine going, and a hoy or lahorer can attend to it. It is, moreover, very compact and portahle. The one-man engine, for instance, occupies a floor space of 2 ft. 4 inchee hy 1 ft. 10 inches, and stands 3 ft. 11 inches high and weighs 4½ cwt.

THE WATCH IN MECHANICS.—Perhaps one of the finest examples of mechanical accuracy is the watch. It is simply marvelous that a little instrument, snhject to constant changes of position, oiled nnce in a year—or perhaps two—receiving its motion from a spring, and the whole contrivance subject to great fluctuations in temperature, should go on marking the time within a few seconds for a year. Or, to look at it another way, that the halance wheel, upon which the accuracy of the motion depends, should, in making 100,000,000 or more vihrations under the adverse conditions noted, have failed hy only a trifling number to have mede exactly whet it should have done. The watch, perhaps, of all machines, is the finest exsmple of what persistent effort in the direction of perfection mey accomplish, and it is worthy the c nsideration of the mechanic ss an example of the adeptation of means to the end in view.—*American Machinist.*

LUBRICATING HEAVY BEARINGS.—In a recent foreign invention for luhricating heavy hearings the oil ie pleced over the shaft which is to he luhricated. A spindle is driven hy an arm and a little hand. This spindle is iu the upper part of the hox and inside, the box contains a worm which runs into a spur wheel. A pin on the spur wheel plays in the slotted arm of a double-ended lever. The ends of this lever are shaped like a spoon. This spur wheel with the pin is driven hy the worm, and at every revolution dips one end of the lever—the spoon-shaped end—and lifts the luhricating end, whatever it may he. When this end containing the material is lifted higher than level with its center, the oil flows from the spoon towards the middle of the lever and down through a hole which leads to the oil holes of the hearings.

ENGLISH steel castings are made hy some firms from old files, in connection with other material, and are said to he eound and very etrnng. It ie said that the excess of carhon in the stock is found no disadvantage.

SCIENTIFIC PROGRESS.

Proposed Storage of Electricity.

It has been suggested that Faure batteries he so connected with lightning rods as to accnmulate the electricity of storm. In this way it is thought a vast amount of electricity might be stored for mechanical uses, "with results exceeding anything evsr dreamed of in perpetual motion." To this plan the *Scientific American* snggests several objections, as follows:

In the first place an electrical condenser would he hctter adapted for the storage of the high tension cnrrents developed in storms than the Fanre battery is. The metal plates snd acidulated water of the Fanre hattsry would form so good a conductor for lightning that very little chemical work would he done in it; and it is this chemical work by the electric current wbicb "charges" the battery, snd thns prepares it fo1 the subsequent redevolopment of electric energy under proper conditions. Experimsnts which we have made with the high tension cnrrents developed hy a Holtz machine show that such currents do have an sppreciahls effect upon the Faure hattery, hut the quantity of energy stored is comparatively very small.

By the use of condensers lightning might he stored, hut such high tension electricity is as ill adapted for the opsration of mechanical motors as dynamite is as a fuel for the steam engine.

Even if the sudden and violent energy of lightning could all he locked up hy chemicel action, and subsequently redeveloped in a quantity current, as in the Faure hattery, the quantity of electricity to he had from storms is too small to pay for storage.

In one of his experimental investigations, Faraday determined that to decompose a grain of acidulated water an electric current powsrful enough to keep red hot a platinum wire one one-hnndred-and-fourth part of an inch in thickness, must he sent through the water for the spacs of thres minutss and three-quartere.

This quantity of electricity he shows to he equal to 800,000 charges of a Leyden battery of fifteen jars, esch contsining 184 square inches of glass coated on hoth sides, eqnivalent to a "powerful flash of lightning." In other words the quantity of electricity involved in the lightning stroke—and it is quantity alone that is available for mechanical use—is very small.

In another connection Mr. Faraday demonstrates the fact that the electricity which decomposes a certain quantity of matter—a grain of water, for example—is exactly equal to that which is evolved by the decomposition of the same mattsr.

An ordinary galvanic cell, therefore, must evolve as largs a quantity of electricity as would suffice for a respectahle storm. For so smell a quantity of electricity it ohviously would not pay to eet an expensive trap in the form of Faure batteries and lightning rods, even if the electricity of storms could all he captured that way. It would he vastly cheaper to generate the same quantity of electricity hy means of galvanic hatteries; and there are many cheaper sources of mechanical energy than the galvanic hattery is.

LARGE PHOTOGRAPH.—The wonders and possihilities of photography are constantly increasing. The latest achievement in this direction is recorded as follows: A photograph, prohahly the largest ever printed on a single sheet of peper, is now on exhihition in the art gallery of the American Institute, Now York. It ie not uncommon to see several views which have been separately printed on smsll shsets of paper and pasted together to make a panorama of large industrial works, etc., hut this remsrkahle specimen was printed from seven nsgatives on one sheet of peper, and covers an area of over 10 ft. in length hy ahout 18 inches in hight. It is a panoramic view of the Centsnnial grounds in Philadelphia, and eo perfectly are the negatives joined, that it is impossible to locate the joints. Were it not for the announcement of the exhihitor that it was printed from eeven negatives, no lay observer would imegine that it was other than a single view printsd from a eingle negative. Duplicates of this picture have heen sold at very high prices as sample works of photo art. One was presented to Queen Victoria, and is seid to occnpy a conspicuous place in the royal gellery. This work is from the gallery of F. Gutekunst, No. 712 Arch street, Philadelphia. His exhihit includes other fine specimens. A notahle one is another picture five ft. long hy 18 inches high, also on a single sheet.

AN ANCIENT GREAT LAKE IN THE WEST.—The last quarterly report of the Kensas State Board of Agriculture contains the following: "In the geological developmentit is conceded hy scientists that the eastern portion of Kansas, a portion of Nehraska, Southern Iowa, Northern Missouri, etc., was once covered hy a vast fresh water lake, and this hody of water received numerous rivers and smaller streams; and that their turhid waters deposited a sediment, varying from four ft. to 150 ft. thick."

DISCOVERY OF EXTENSIVE PINE FORESTS.—The recent exploration party of Col. Mercer up the Spanish river, in the province of Ontario, is said to have discovered vast pine forests, conteining upward of 24,000,000,000 ft. of a superior quality of pine lumher, with facilities for getting it to market equal to the hest.

Spontaneous Oxidation of Mercury and Other Metals.

Mr. Berthelot has suhmitted to experimental verification the question so long discussed without final settlement, whether mercury dissolves the oxygen of the air and oxidizes, even at ordinary temperature. Perfectly pure mercury was placed in a retangular dish of porcslain exposing a surface of 500 sq. cm. ahout, and covered loosely with paper. After 48 hours at a tempsrature of 10°, the metal yielded a slight pellicle to a tnhs of glass passed over it. This waa removed from day to day, and showed on analysis the presence of mercnrious oxids. Ths slow oxidation of pure mercnry in contact with air can no longer he donbted. The same is true of iron, zinc, cadmium, lead, copper and tin. Now thermic data explain this phenomenon. For each equivalent of oxygen fixed by the metal, iron (rnst) evolves 31.9 calories; tin, 34.9; csdmium, 33.2; zinc, 41.8; lead, 26.7; copper, 21.0, and mercnry, 21.1.

This oxidation in the air, howsvsr, is not appreciable in the case of mstals whose heat of oxidation is small. Silver, for exampls, evolves only 3.5 calories per equivalent of oxygen ahsorhed. The fact that a resction hegins spontaneously only in the case where a notahle evolution of heat tskes place, is a result not unfrequently observed; seeming as if there was a certain resistance to he overcome, a certain preliminary work to he accomplished in order to determine the reaction. But this action hecomes more prompt and more easy when an auxiliary agent is made to intervene capahle of combining, with evolution of hsat, with the substance at first formed; so that the total energy in action hecomes greater.

This is the action called in early times predisposing affinity. If, for example, mercnry ho placed in a flask and hydro-chloride gas be mixed with the air in contact with it, ths walls of the flask will he covered after a time with mercurious chloride. Now, hydrochloride alone does not act on mercury at all under these circumstances; the oxygen of the air intervenes, ths reaction $Hg_2 + HCl$ gas, $+ O = Hg_2 Cl +$ HO liquid evolving 53.4 colories. So silver, which is not acted on hy oxygen alone, is easily converted into chloride in presence of hydrochloride gas in addition, the reaction $Ag + HCl$ gas $+ G = AgCl +$ HO liquid evolving 41.7 calories. So silver in contact with air is attacked hy a solution of sodium chloride, copper hy hydrochloric and acetic acids, led hy acetic acid, etc. In the case of mercury and hydrogsn sulphide, in presence of air, the hydrogen is oxidized, the sulphur finely dividsd is precipitated and acts upon ths metsl. The same mechanism taks place with silver.

ARE MEN'S HEADS GROWING SMALLER.—A correspondent of *Nature* says that an opinion is prevalent in the hat trade that the sizs of men's heads has undergone a decrease within the last 30 or 40 years. It is held that heads generally are now fully two sizes smaller than 40 years ego. A head of more than 24 inches in circumference ie now quite a rarity, while thousands of hats are made of 21 inches. There are some, however, who think that the diminution is more apparent than real—that it is observed mostly among grooms and men of that class in the sooial scale, and that it is possihly traceable to alteration in the style of hair-cutting or of wearing the hat.

BALLOON SOUNDINGS.—Aeronauts have a nnique method of taking "sonndings" to learn their distsnce from the earth when they are heing swept rapidly along in the night. According to the Signal Service officer who recently accompanied Prof. King on his perilous journey from Chicago to Wisconsin swamp, a loud shout is given, and then the seconds are counted until the echo from the ground is heard. The hight is estimetsd hy the time required for the return of the sound.

CELLULOID.—A new cslluloid is said to he ohtained from well-peeled potatoes, which are treated for 36 hours with a solution of eight parts of sulphuric acid in 100 parts of water. The mass is dried hetween hlotting paper and then pressed. It is further stated that in France smoking pipes are manufactured with this new material which are quite equal to meerschaum. By heavy pressure the meterial acquires such a hardness that hilliard halls csn he manufactured from it.

NEW TANNING PROCESS.—A process of tenning with hichromate of potash has recently heen disoovered, and a company, which inoludes a numhsr of capitalists in New York and some Boston leather dealers, has hought chrome mines in California, and will manufectnre the hichromate and carry on a tanning business.—*Springfield Republican.*

HARDENING STEEL.—For hardening thin steel articles Dr. Hartman recommends: 4½ qts. of train oil, 2 lbs. of heef tallow, ½ lb. of heeswax, and 1 lb. of resin. The exact amount of resin, however, is a matter of experiment, always hearing in mind that the greater the proportion of resin the higher the temper. Another mixture recommended on the same authority, is 95 qts. of spermaceti oil, 20 lbs. of tallow, 4½ qts. of neats-foot oil, 1 lb. of pitch, and 3 lbs. of resin. The pitch and resin are melted, the other ingredients added, and the whole heated until it will ignite if a hlaze is hrought in contact with it, when it is covered and allowed to cool.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Northern Belle, Dec. 14th, $16,816; for December to 14th, $28,419; Great Basin, 17th, $1,950; Horn Silver, 18th, $32,500; Ophir, 14th, $21,000; Northern Belle, 14th, $4,621; Day, 12th, $7,750; Contention, 14th, $13,465; Standard. 12th, $42,338; Northern Belle, 14th, $5,753; Silver King, 14th, $23,000; Regent, 16th, $4,700; Savage, $9,518; Bodie, 19th, $6,-018; Contention, 16th, $16,853; Northern Belle, 17th, $7,038; Head Center, 18th, $9,145; Horn Silver, 17th, $15,000; Jay Gould, 17th, $4,400; Pascoe, 17th, $1,100; Hananer, 17th, $2,610; Germania, 17th, $1,250; Mayflower, 13th, $3,-816; Hanauer, 13th, $2,250; Horn Silver, 13th, $7,500; Mammoth, 13th, $1,677; Barbee & Walker, 13th, $1,708; Bullionville, 13th, $4,-917; Hanauer, 14th, $2,460; Bullion, 4th, $2,-450; Horn Silver, 14th, $35,000; Barbee & Walker, 14th, $2,376.

New claims are to be opened next season on the Klamath, and shafts for prospecting are now being sunk. Empire Bar, at the mouth of Empire creek, will be worked on an extensive scale, lumber being now hauled, of which over 10,000 ft. bas already been delivered.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

Stocks bave been down in the mouth during the later part of the week. Assessments levied by 22 mining companies become delinqneut dnring the current month, the aggregate amonnt called for being $380,150, the smallest of any monthly aggregate during the year 1881. Of the assessments levied $269,500 is on account of Nevada mines, $80,650 on account of California mines, and $30,000 on account of Arizona mines. During the year 1881 the various mining companies have levied 364 assessments, aggregating $9,385,160.

The Savage mine shipped four bars of bullion valued at $9,518, the other day. This is the first shipment of any importance in quite a number of years. It is tbe proceeds of some low grade ore, which is being extracted from the upper levels, and which is represented to yield a small profit. The ore is being reduced at the Santiago mill, and the clean np for the month, which will give a still larger amount of bullion, has yet to follow.

In the Savage, the No. 1 drill hole (according to the *Enterprise* of the 21st), which probably went into the roof of the incline, is discharging water to its fnll cspacity. The hole is 2¼ inches in diameter, and the water flows out of it with considerable force. Just where this hole strikes, as regards the bottom of the main Savage incline, no one knows. At first it was thonght it had gone too low and was in the rock under the floor of the incline. Then, on consaltation with the men who ran the hole, it was thonght the drill might have struck into the bottom of the incline. The reason the men in charge thought so was, that at the hight of ahont 94 ft., they fonnd the drill "running light;" that is to say, rnnning as thongh it was in contact with nothing. In order to satisfy themselves, they forced the drill npward without revolving it in the usnal way, and found that they were able to pnsh it up into some kind of soft material. Under these circnmstances the hole was abandoned, bnt it soon began to discharge water to its full capacity. Bnt that the water lowered very little in the bottom of the main incline, it wonld have been thonght that the incline was tapped. As it was, and seeing that the water in the incline remained ahont the same, the company arrived at the conclnsion that the drill hole went above the incline, and was discharging live water.

Geographical Society.—Capt. Hooper, of the U. S. Steamer *Corwin*, a few days since, delivered a very interesting lecture concerning his trip to the Arctio and the landing on Wrangell Land. The paper was read hy Prof. Davidson, and the interest greatly hightened hy excellent stereopticon views thrown on a large screen. These views were prepared, and the stereopticon portion of the lecture arranged by Prof. James, who is with I. W. Taber, tbe well-known photographer. The same gentleman managed, with equal ability and skill, the stereopticon for Lieut. Gorringes' lecture before the Academy of Sciences. After attending these, many persons will not hereafter want to attend a lecture without the accompaniment of stereopticon views.

Meetings and Elections.

Winthrop M. Co., Dec. 15. Directors—John Spruance, (President), S. L. Stanley. (V. P.), A. C. Springer, J. M. Magner, C. W. Jones. Halleck Wright, Secretary.

North Star M. Co. Directors—R. A. Robinson, (Prssident), A. Summerfield Jr., Treasurer, J. W. Farren, A. Quinn and O. Breslin. J. T. Barry is Secretary, and W. D. Farren Superintendent.

Mount Diablo M. Co., Dec. 19. Directors—H. H. Allen, President; W. E. Norwood, Vice-President; R. W. Heath, Secretary; W. H. Shockley, Supt.; Bank of California, Treasurer.

Gould & Curry, Dec. 14. Directors—W. S. Hobart, A. B. Hull, A. Hayward, Robert Sherwood, Wm. Kohl, S. Heydenfeldt, Geo. Congdon. At a meeting of the Board of Directors the following officers were elected: President, W. S. Hobart, Vice-President, A. B. Hull; Secretary, A. K. Durhrow; Supt., H. Penoyer.

The following figures from the Secretary's statement will show the status of affairs:

Receipts.—Cash on hand Nov. 30, 1880, $15 192.53; assessment No. 30, (50c) $54,000, assessment No. 40 (50c) $54,000 - $108,000. Mine account: supplies sold, $32,111.06, machinery sold, $1,000—$33,111.06. Balance cash indebtedness, $13,031 40—$160,934.09.

Dishursements. — Minn: sundry supplies, $5,075.36; wood, $25,913.08; labor and salaries, $12,463; C. & C. and B. B. joint shaft, $113,251; general expenses (Virginia) $324.10; advertising. $574 50; stationery and printing, $344.25; office and general expenses (S. F.) $1,338 80; exchange, $024.50; interest, $265.49; taxes, $2,430.63; legal expenses and adverse claims, $3,000; joint fan account, $8,329 68. Total, $160,934.09.

Idaho Quartz Mine.—At the annual meeting of this Nevada county mine held on the 12th, the following were elected as a Board of Trustees to serve for the ensuing year: John C. Coleman, Edward Coleman, George W. Hill, Eugene C. Creller and M. P. O'Connor. The Board was organized by the election of Edward Coleman, President; Eugene C. Creller, Vice-President; John C. Coleman, Treasurer; George W. Hill, Secretary. Edward Coleman was re-elected Supt. We reserve comments on the report until next week.

"The Californian."—This popular home magazine comes out in the January number (jnst received) in a superior quality of calendered paper, and with improved typographical appearance. A glance at the tablo of contents shows the magszine deals with live topics. Walter Frear contribntes a paper npon the lahor system which prevails in the Hawaiian islands. B. B. Redding has an able contribution, entitled "Immigration, and How to Promote it," and C. T. Hopkins furnishes an article upon the "Restoration of American Shipping." James O'Meara continues his series of biographical sketches in an article on the frontiersman, Capt. Anhrey. In the way of lighter literature, Miss Shinn has a charming Christmas story, entitled "Friday's Child." Miss Sargent, danghter of Senator Sargent, contribntes a powerfnl and original tale, "We Wi Ping." "Coh-weh and Crnsty" is continued. There are also poems hy E. R. Sill, B. P. Wall and Chas. H. Phelps; ahle reviews upon late publications; "Outcroppings," hy Lock Melone, etc. Mr. Chas. Phelps, who has been sole proprietor since the June number, has creditahly maintained the work, and has the good wishes of a host of friends of the magazine for his continned success.

Mechanical Lecture.—The lecture at Capt. McNevin's hall this week before the apprentices and yonng mechanics was delivered hy S. H. Wheeler. Subject, "Construction of Boilers." Next week Capt. McNevin will deliver a lecture on "Color Blindness," a subject now attracting attention, and one of great interest.

The Marqnis of Lorne has decided to remain in Canada another three years as Governor-General.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Sutter Creek.—Amador *Dispatch*, Dec. 17: Work at the Con. Amador is progressing very satisfactorily in the north and west drifts. There was some very rich ore taken from the 800 level, at the Mahoney mine this week.

CALAVERAS.

Work Commenced.—Calaveras *Chronicle*, Dec. 17: Preparations for prospecting the famous Lamphear mine, have commenced. Mr. H. F. Lambert, the energetic Supt., is pushing operations. The road to the mine has been repaired, and the grading for the erection of the hoisting works has also been started. All the teams that could be engaged in this vicinity have been pressed into service to deliver the required lumber on the ground. Mr. John Rider, an experienced millwright, has been engaged, and Messrs. Donnelly & Co., foundrymen of Sutter Creek, Amador county, have contracted to supply the machinery. Work is progressing rapidly and it will be but a short time before work in the mine will be commenced.

Corral Flat Mine.—We visited the Corral Flat mine one day this week and besides a look at the steam hoisting works and the mill, we were afforded an opportunity to go down in the mine and through the works where the force of men was at work At the bottom of the shaft we were conducted through the main drift, extending nearly due north, a distance of 275 ft. This drift is still being advanced through a solid gravel bed. Leaving the main drift we proceeded to where the operation of "breasting" was going on in a spendid body of gravel exceedingly rich, as we were readily convinced by the discovery of fine specimens of gold imbedded in the gravel in the face of the "breast." The extent to which this gravel bed has been worked in former years has been greatly exaggerated. There is a vast body of it yet remaining to be worked, as can bs seen hy an inspection of the works, and it is unquestionably rich.

EL DORADO.

Bear Creek.—Georgetown *Gazette*, Dec. 16: The late rain in this locality bas again brought the miners to thn surface. It is the belief of most every one here that mining is now being about as vigorously executed as it was in the "golden days of '49." There are six hydraulic mines in our camp, besides numerous claims that are being run by pick and shovel. Mr. Terry is now fitting up his hydraulic mine on Slug gulch. There seems to be quite a stir here at present about quartz. There are several developments now being made, of which we will be ablo to give an account in our next epistle. The Twin claim on Travers creek, is now being fitted up by its owners who are energetic and practical miners. We expect to hear of something extra from this mine before long, judging from the prospects we happened to see from it not long since Edwin Demuth and Hiram Ackley have been rigging up a hydraulic on Fair Play Canyon.

A Rich Strike—*Mountain Democrat*, Dec. 10: A very rich strike was made in the Bowker mine, Kelsey township, last Saturday morning. This strike was not in or directly connected with the fine development from which the recent clean-up was made The latter is near the surface and adjacent to the hanging wall, being a body about 20 ft thick of very profitable ore, but in which the gold is quite fine, disseminated throughout the quartz and little or none is perceptiblo to the naked eye. The development of last Saturday was made in a drift that is being run hy contract to the southward along the main ledge from the tunnel that was recently run across the ledge from the near vicinity of the mill Tbo ledge, where this tunnel crossed it, was 80 (not 8, as the telegraph reported it) ft thick. After this tunnel was run across the ledge, drifts were started in both directions. In the south drift, about 20 ft from the main tunnel, a heavy blast was put in about half past one o'clock last Saturday morning, and when the contractors came to examine its effects their eyes were gladdened by a dazzling sight. The rock thrown down hy the blast, and the face of the drift back of it, were literally studded and plastered with free gold. The full extent of this strike has not yet been ascertained, but a considerable quantity of thousand dollar rock has been taken out, and there is every indication that this pay streak is extensive. Independent of this most exhilarating find, recent developments had been of such an encouraging character that preparations were being made for setting up 10 additional stamps in the mill, a new rock-breaker, and other improvements.

INYO.

The Southern Country.—Bodie *Free Press*, Dec. 20: Si Ryan says that things are booming in Inyo county, where the mining business is picking up. Several transfers bave recently been made, and capital is being brought into the country. Independence, the county seat, is busy during court times. The climate there is an improvement on what we have here. There is no snow, except on the mountains. Bishop Creek is growing in importance, and the residents feel confident that next summer there will be a mining excitement thereahouts. The grass is green at this season, and the weather delightful.

MARIPOSA.

Local Notes.—Mariposa *Herald*, Dec. 17: The new compressor at the Hite mine is now in full operation and working satisfactorily. Louis Isola, of Coulterville, was in town Sunday evening and reports his mine in a promising condition. The hoisting works at the Compromise mine, near Bull creek, Coulterville district, have been started up and are now running at full blast. Work at the No. 9 mine, near Hornitos, goes steadily ahead, and is paying very well so far. The mine bids fair to replace the Washington. John Schroeder has completed laying the pipes for 800 ft in length conveying water to his placer mine in Saxon's creek. As soon as there is a little more rain, lively operations will commence at this mine. As we stated last week, all work has stopped on the Washington mine, near Hornitos, some of the pumps have been withdrawn, a portion of the machinery hauled away, the store and bar sold to the No. 9 Co., and the place has a graveyard looking appearance. The mine on Sweetwater owned hy Peter Gordon, William Simpson, Fred Schlageter and D. F. Egenhoff, is now being prospected and worked. They are also crushing ore in an arastra with most favorable prospects. A tunnel on the vein has already reached a distance of 100 ft. There is a large amount of machinery and lumber being hauled to the Mt. Gaines mine, near Hornitoe. The mill at the mine was burned down several years ago, and the lumber is to rebuild the mill, then the machinery will be replaced, after which work will be resumed on the mine. It is a good mine. During the past 2 weeks we have noticed a large amount of machinery, loaded on freight wagons, pass our office, and are informed it is all for the Modesto S. M. Co.'s works, which are situated a few miles below town. There is no doubt but that there will be interesting developments made at these works as soon as the Co. get their machinery in working order.

Hornitoe.—Cor. Mariposa *Gazette*, Dec. 17: The Yosemite Co. has purchased the old Gaines mine and property, the machinery for the hoisting works having already been shipped from below, and work will start up this week or the first of next; thus many of the old hands thrown out of employment by the shutting down of the Washington mine, will find employment close at home. There is now about 50 men working at the Yosemite mine and mill, and as soon as a new shaft can be sunk on the Gaines, there will be as many hands put on as can be worked to advantage. The Yosemite mine is paying a dividend, and has done so every clean-up since Frank Thorn has had the management of its affairs, the last clean-up being the largest. I understand that the parties working the Quartz Mountain

mine have leased the Campidonico mill, and will crush their rock there, or at least enough to prospect it. The old silver lead near the Washington mine is paying well. So much for the mines.

DILTZ MINE.—The news from this mine is of a most cheering character. Capt. Diltz is running a breastwork upon the mine of 110 ft in length, by from 40 to 60 ft in depth and conveying the dirt a short distance by cars to the dump and flume, where it will undergo the process of washing as soon as there is sufficient water. The breastwork mentioned shows 30 separate stratas of gold-bearing quartz of various widths radiating out from the main vein, some of which is decomposed and shows rich with free gold. About 30 tons of dirt per day is taken to the dump, and about the same quantity of pay-rock is piled up for milling purposes. This extensive work is all abreast of the main vein, which is left unmolested for the present. The whole hill appears impregnated with gold, as not a pan of dirt can be found but will show colors of gold. The value of this mine is being appreciated more highly, as the work progresses and new developments made.

RED BANK.—The hydraulic process of mining went into full operation on Monday last at the Red Bank, Merced river. The late rains have afforded sufficient water for present purposes, with a probability of its being continued through the winter season. This work, which is under the management of Col. Swalley, gives employment to about 20 men, and is of material benefit to that locality. Should the "big clean-up" which is expected to take place sometime during the spring result favorably, of which there is little doubt, the Co. will order lumber for the large flume which has been in contemplation, to extend from the Benton dam down the river a distance of two and a half miles. This would afford water all the year round.

MONO.

BODIE.—*Free Press*, Dec. 20: The mining situation remains about the same as last reported, with the exception that an improvement is noticeable in the Boston Con. mine. Quite recently a ledge of importance was exposed and everything points to its improvement as advance is made. Nothing more has been reported regarding the strike in Concordia. It is stated on good authority that a development of importance has been made in that property. Such an event is to be hoped for, and its existence would help the entire south end of the district. The Standard Con is still sinking its shaft, while good ore is being extracted as usual. Owing to a break in the Bodie tunnel mill that Co. has crushed but little ore of late. The pulverizer is to be replaced with stamps as the ore is too hard for the pulverizer to crush.

NEVADA.

MINING CAVE.—Nevada *Transcript*, Dec. 15: A gentleman, who came down from the upper part of the county, night before last, gives us an account of another big cave that occurred during the storm of last Saturday night at the Blue Banks mine, Moore's Flat. An immense section of the ridge came tumbling down upon the bedrock, burying everything beneath it. Both the sluice and the drift tunnels were choked up, a corner of a house was swept away, and an immense amount of damage was done. It is said that some of the sliding matter found its way nearly to the river before stopping. This disaster will prevent further operations at the mine for some time, and entirely cut off the gold supply for the winter it is expected. Last September, it will be remembered, another big cave occurred at the same claim, and the owners were getting the debris removed when the last one came. The Blue Banks ordinarily gives employment to a large number of white men who will now have to seek elsewhere for a livelihood. Since writing the above, we have been told that the Boston mine, adjoining, also suffered from the slide, but not so seriously as the Blue Banks.

MINING ENTERPRISE.—*Tidings*, Dec. 17: Mr. Cornelius Riley has leased the Stockbridge and Ford and Riley mines, situated on Massachusetts hill, and in a short time will commence work on the ledges. These mines have a good history and the prospective opening of them is looked upon with interest in mining circles of Grass Valley. Mr. Riley has known all about this ground for many years, and knows what he is about.

PACIFIC CON. MINE.—The directors of the Pacific Con. M. Co. held a meeting Wednesday, and resolved to go ahead with work on the property of the company. The mine is down on Wolf creek, in the famous Allison Ranch vicinity.

MINING AT CHAPMAN RANCH.—*Transcript*, Dec. 20: Chapman Ranch is now one of the liveliest quartz mining localities in this district. At the Underwood & Murphy mine from 10 to 12 tons of ore are being extracted daily, and hauled to the Deadwood mill for crushing. Mr. Green, owner of the Seventy-six mine, has bonded it to a San Francisco company who announce their intention to erect hoisting works that will be run by water power. The Lizard claim, parallel to the Seventy-six, and adjoining the Underwood & Murphy on the north, is owned by D. Leahy. The croppings prospect well and a shaft is being sunk on the ledge. The Virginia City Co. are taking out pay ore regularly. They have it milled at the Deadwood and the Pioneer.

PLUMAS.

ELIZABETHTOWN.—Crescville *Bulletin*, Dec. 14: Before selling their mine at Elizabethtown to Messrs. Corbin & Manson, the former proprietors in working 230 lineal ft, took out $27,000. Messrs. Loring & Leavitt had very rude machinery and limited means. The present owners of the property first prospected the ground thoroughly; being fully satisfied with the result, pumps and hoisting machinery have been put up, that will permit of working the mine to the greatest advantage. Good, comfortable buildings have been erected, and everything done that experience and foresight prompted for the most energetic prosecution of the work. The last shaft put down was continued into the bed rock about 20 ft. This gives place for a good sump, and is also a solid bottom for the shaft. About 6 ft above the sump a tunnel was started off; this has now gone through the rock and is in the gravel. The work in this tunnel will be pushed as far to each direction as will be economical to carry the dirt, when a new shaft will be sunk and the same process repeated until the whole ground is worked out. The depth is only about 60 ft, so sinking a shaft is not very expensive. A flume 4 ft wide and 2 ft deep has just been laid from the upper end of the claim down past the two shafts now being worked. This will easily carry all the water not needed for washing, and keep the works comparatively dry.

SIERRA.

RICH STRIKE.—*Mountain Messenger*, Dec. 17: We are informed that at the Alaska quartz mine, Pike city, the company has struck a veritable bonanza, as rich, in fact, as the celebrated Rainbow mine, of Chips flat. Persons who saw the pieces of rich rock say it was immense in its richness. This ledge paid well some 15 years ago, when it was owned by Sterrett and others, and handsome dividends until a point was reached where it could not be worked economically without heavier machinery. The present company has expended a large amount of money in the development of this property, which we trust they will soon get back.

RUBY.—The spot of gravel found in the Ruby tunnel has not yet been proven to have belonged to any defined gravel channel. Workmen are pushing a drift east from near the top of the shaft where the gravel was found.

GOOD START.—The Bald Mountain Co. have made a good start towards getting rid of the dirt in their small dump, and still have a fair head of water. The late cold weather has checked the water in this section considerably.

DERBEC.—The Derbec mine, of which Roht. Denoon, brother of J. P. Donoon, is Supt., has discharged nearly all of its men, keeping only 4 or 5 on a shift. A large number were at Forest City this week looking for work.

STOPPER.—The pumps at the Pliocene shaft, used by the Bald Mountain Extension to furnish water for air and washing at the mine, have been stopped, there being sufficient water in the South Fork to answer all purposes.

GOOD YIELD.—The Bald Mountain Extension cleaned up their large dump last week, and realized 241 ounces, and the most of the dirt in the dump was waste. For two days' run last week 48 ounces was realized.

GOOD HOPE.—The Good Hope mill will probably be ready to run in about 10 days. A fair quantity of ore is on the dump, the hauling of which, about a quarter, is what is delaying the work.

BLUE GRAVEL.—The bedrock in the Blue Gravel tunnel has suddenly raised, and the tunnel is now all in rock. The owners consider this a good indication.

INCREASED.—The Bald Mountain Co. has increased its force, since it got water, by all the men in town who wanted work.

CONTRACT LET.—The Bald Mountain Co. have let a contract to run 500 ft of tunnel toward the extension to John Cashman, Mr. Johns and Wm. Culbert. The tunnel is to be 9 ft on the bottom.

CENTENNIAL DRIFT MINE.—Eight Forest City mining men, under the name of the Centennial Co., are engaged in developing a drift claim at Minnesota, two miles from Alleghany. They began work there in 1876, by running a tunnel through hard rock a distance of 800 ft, when they became satisfied that they were at too low a point on the ridge to tap the channel. Going some distance above that point they put a tunnel through 200 ft of barren gravel, and sank an incline to a depth of 100 ft, when they had to stop on account of being unable to handle the water. Another tunnel is now being driven 65 ft below the second one. It extends through bedrock for some 400 ft, about 60 ft being in gravel that prospects so well as to give the owners much encouragement. No work has been done since last July, but it is proposed to start the mine again without delay, that the rainy season has set in. During the 5 years they have been at work, the Centennial Co. have expended probably not less than $15,000.

TRINITY.

VERY DULL.—Trinity *Journal*, Dec. 17: While the late rains have not been sufficient to start hydraulic mines, they have succeeded in placing the roads in bad condition for traveling. But few outsiders now come to town, and as a consequence the town is dull.

TAYLOR FLAT.—It may be of some interest to your readers to learn that the country from Cox's bar to Burnt ranch is beginning to look up; the mines yielding more, and the people better content. We have had copious rains, the most of the water drank up by the thirsty soil, and the small streams have been but little affected; the larger have sufficient, especially French creek, and the Trinity hydraulic gold mine is now in full blast with all its appointments in so good order as money and labor can put them.—If you don't think so, enquire of your County Surveyor, whose judgment and knowledge will not be disputed—Mr. Lowden, an experienced miner who was down this way lately. Mr. Walker, superintendent, has put up a new flume and boxes, which gives him a 30-ft dump to run off top dirt, and it works admirably, and will be an immense benefit. The river continues low, but it will be some time before a flood is needed to carry away tailings. Pelletreau at Swedes bar is doing exceedingly well and is in fine glee. The gold taken out by him is very coarse and he has no trouble in finding dirt that pays from one to two dollars to the pan.

CONTRACT COMPLETED.—Jo. Falan has finished the 100 ft of the tunnel which he has been running under contract for the Bullychoop and Occidental Co. He tells us that he found some of the hardest rock yet encountered. One ledge known as the "little white lodo," was cut, but the main Bullychoop has not yet been reached. It is probable that the company will contract for a further extension of the tunnel in the spring. The white ledge is about 12 ft in width and carries some gold.

NEVADA.

WASHOE DISTRICT.

CON. VIRGINIA.—The work of cleaning out and repairing drifts and winzes on the 1600 and 1700 levels, for purposes of ventilation, is still going on.

UNION CON.—On the 2700 level are cutting out a drain and timbering up the joint Sierra Nevada connecting drift.

CALIFORNIA.—The work of clearing out and repairing the drifts and winzes on the 1000 and 1700 levels for ventilating purposes is still going on.

GERIR.—During the week 271 tons and 400 pounds of ore have been extracted from the croppings.

SIERRA NEVADA.—The joint Union Consolidated east winze has been sunk and timbered 5 ft and a tank pit is being cut out at the 2800 station.

UNION SHAFT.—Still repairing the drift leading out to the Sutro tunnel on the 1600 level; easing timbers at the 2000 level, and cutting out the bob pit at the 2600 station.

YELLOW JACKET.—The north lateral drift was run to a point 248 ft north of the north winze, at which point a switch was placed and a crossdrift started to the east, which is this day in 16 ft. Cut some seams of quartz in the north lateral drift, giving low assays. The machinery of the mine is all in good order, pumping the usual quantity of water.

SUTRO TUNNEL.—Report for the week ending Dec. 15: Main tunnel, sections 174 to 188—since last report the repairmen employed in the main tunnel near the Combination have placed in position 17 sets, 2 caps and 1 post of new timbers, and removed 8 sets and 9 posts of old timbers, and 4 drain boxes and 4 stringers. Also, some of the repairmen were employed a portion of the week easing timbers and bracing up and lagging the ground.

BRISTOL DISTRICT.

CLOSED DOWN.—The mill of the Bristol S. M. Co. has closed down for a few days, for the purpose of putting in a dry kiln. As soon as this work is completed the mill will resume crushing ore. Since the Day furnace closed down at Bristol a number of the Mormon teamsters have left for their homes in Utah and a few men have passed through here on their way to Bullionville. The Bristol S. M. Co. have purchased a dry kiln down at Bullionville from the Raymond & Ely Co. The Day Co. disbursed for last month's expenses $28,989.95. On Monday the wood and charcoal bills for November, amounting to nearly $8,000, will be paid.

CANDELARIA DISTRICT.

MOUNT DIABLO.—*True Fissure*, Dec 17: The winze from the bottom of winze No. 1 on the third level is down 12 ft and shows a 2½ ft ledge of ore which assays $45 per ton. The east drift from the bottom of winze No. 1 has been stopped. The intermediate, below the third level, shows some very fine ore, and the east drift on this level is giving some excellent ore from small bunches, the chances being favorable for its opening very well. There is no change in the west drift. The east drift on this level is being driven ahead to prospect the ground above the ore found in this part of the mine, on the level below, and is now cutting into some low-grade ore.

NORTHERN BELLE.—For want of air connection work has been stopped in the west drift on the fourth shaft level. There are being extracted and sent to the mills about 60 tons of ore daily. Bullion shipments for the week ending Dec. 14th, amount to $16,316 86. Shipments on December account to Dec. 14th, $28,419.67.

PRINCESS.—The work of excavating for the engine is finished and it will be wheeled into position and set in a few days. The timbers for the gallows frame arrived day before yesterday.

CRABB DISTRICT.

ATTRACTING ATTENTION.—Esmeralda *Herald*, Dec. 17: This district, which is attracting considerable attention at present, is situated on the old Wellington and Aurora toll-road, 9 miles east of what is known as the East Fork bridge, over Walker river, in a heavily timbered and well watered country. Some very rich gold and silver-bearing ore has been discovered, and almost every day new and promising locations are made. Already a number of houses have been put up to accommodate the workmen. An 8-mile haul, all down hill, will take the ore to the river, where grading for a mill has been commenced, just above the Rose stock ranch. A meeting is to be held there shortly for the purpose of forming a new district, making new laws and electing a new Recorder. Before a twelvemonth, we predict there will be no little excitement about this district, as they have the metal there with which to make a lively camp.

ESMERALDA DISTRICT.

OUR MINES.—Esmeralda *Herald*, Dec. 19: The progress made on the Cortez, Centennial, Eva Con., Thanksgiving and the various other mines that are being developed in our camp, is very encouraging, and the indications demonstrate the fact that Aurora must inevitably come to the front as a bullion-producing camp.

GARFIELD DISTRICT.

ORE FOR DAYTON.—Candelaria *True Fissure*, Dec. 17: Jos McClane—man from Garfield district—shipped 12 tons of ore from his mine in that coming camp to the Lyon mill at Dayton, last Wednesday. Mr. McClane went on the same train and will personally interview the railroad and mill authorities with a view to making regular shipments. The ore is thought to be a fair sample and the returns therefrom will be given as soon as the result is known. Mr. McClane will visit his daughter, Mrs. William Manning, in Virginia City, before he returns.

JACKRABBIT DISTRICT.

COTTON-TAIL.—Plochs *Record*, Dec. 12: This is one of the most promising claims in Jackrabbit district, and adjoins the Day claim. The late strikes of ore in the Day ha[illegible]s direct for the Cotton-tail ground. The men working on this claim at present are taking out some excellent ore. Next week the working force on this mine will be doubled, as it is the intention of the owner, J. C. Lynch, to sink a shaft and tap the ore down deep.

MAMMOTH DISTRICT.

WORK.—Cor. Grantsville *Bonanza*, Dec. 17: Mammoth mining district is not forgotten, nor has her glory as a meritorious mining camp gone, but the day is near at hand when she will proudly step to the front as a bullion producer. Work on the Esta Buena is progressing nicely. The Esta Buena Co. have quite recently bonded the Silver Wave mine for $15,000, paying 5% cash. Esta Buena—depth of main shaft 305 ft, at this depth have run levels during the last 7 months 1,200 ft for prospecting purposes. Have drifted on ledge 300 ft, the average width being 2 ft. In face of drift at this time the ledge is 4 ft in width; average assays of ledge $278; character of ore antimonial silver. Silver Wave—depth of main shaft 80 ft; average width of ledge 2 ft; average assays and character of ore about the same as in Esta Buena, and it is without doubt the same ledge. The Esta Buena Co. have recently purchased from the Rock Island M. and M. Co. their 10-stamp mill, assay office, boarding house and other buildings situated in this place.

PUEBLA DISTRICT.

THE PUEBLA COPPER MINE.—*Silver State*, Dec. 20: J. C. Wear is in from his copper mine in Puebla district. He says it is looking splendidly. There are large bodies of ore in sight in the mine, and four men are working steadily opening up the property and extracting ore.

SANTA FE DISTRICT.

A BIG SULPHUR MINE.—Candelaria *True Fissure*, Dec. 17: B. G. Smith brought into town yesterday some very fine specimens of native sulphur from his mine in Santa Fe district. The sulphur is in a large vein from which blocks weighing 100 pounds and more can be broken. The walls are of gypsum and the amount of sulphur seems illimitable. In quality it analyzes 87% and appears like that fed to the rising generation mixed with molasses. There is enough of it in this one mine to prove Ingersoll's theory a fallacy, because one can set fire to it and have a little hell of his own in 10 seconds.

TYBO DISTRICT.

TYBO DEPOPULATED.—Reese River *Reveille*, Dec. 12: We understand that mining operations in Tybo have been entirely suspended, and the people scattered to other sections. There is said to be but 8 persons left in the town, the Postmaster one of the number. That whole section of country is pretty much abandoned, excepting now and then a stockherder or rancher. Daily mail service continues through there between Eureka and Belmont, being performed with a one-horse buckboard. There is said to be a distance of 90 miles along the route where there is neither food nor fire to warm by to be had. At one time Tybo was a town of considerable size, and the Two G. mines producing ore of a paying quality; but like many other mining districts, it had its day, and from a combination of causes, gave up the ghost and passed in its checks.

ARIZONA.

MINES BONDED.—*Journal*, Dec. 17: The Southern Pacific and Oakland mines in Tyndal district, Santa Rita mountains, have been bonded to Eastern capitalists for $30,000, to be paid in 60 days. The owners of the mines are Mark Ezekiels, Mark Lully, Mose Lully and Chas. Altschul. The experts who came here from New York to examine the mines, have returned home well satisfied, and think they have a bonanza.

TYNDAL DISTRICT.—*Citizen*, Dec. 13: F. F. Cranz is in town from Tyndal mining district, Santa Rita mountains. He reports an amount of activity and interest in that camp heretofore unknown, and thinks that the slowness that has previously characterized it has disappeared forever. The new road from Tubac to Solari is being rapidly pushed, and great progress has already been made. Under the energetic superintendence of the overseer, Mark Lully, the road will soon be completed, and no doubt will be equal to any in the country. The companies for which Mr. A. R. Cecy is superintendent, are grading for their 30-ton water jacket furnace, and they propose carrying the work on to completion with undiminished energy. Prof. Dana Harmon, Mr. P. McArthur and D. W. Neil are doing considerable in the way of development on their properties. They are also grading a roadway to their mill site, where they propose, at an early day, to erect a stamp mill, which the present appearance of their mines unquestionably warrants. The number of stamps has not yet been decided upon. The camp is having a boom which it is to be hoped will continue, and it will no doubt become, ere long, another one of the bullion producing districts of our country.

SOLOR DISTRICT.—*Silver Belt*, Dec. 18: The cause of the stoppage at the Globe City mill is the absence of necessary material. Mr. Monroe is making ready for the erection of the Centennial Co's. mill. He will utilize the cut stone work already in place. The foundation for the engine bed will be commenced at once. There will be some unavoidable delay in the procuring of lumber, but not of long duration. We were shown some fine crystals, taken by Mr. Deveraux, from a copper mine at Dripping Springs, which he called "yellow garnets." There is a large quantity of the formation in the mine, and it carries lime and iron; it furnishes a flux for the ores.

IDAHO.

COMING IN.—Challis *Messenger*, Dec. 10: Miners generally are coming from their summer fields, and either going out to see the Utah, San Francisco or States fashions, or going into winter quarters here. And never before did they rest so easily—the mines are looking so well.

STANLEY BASIN.—Yankee Park *Herald*, Dec. 12: This is generally supposed to be a played-out placer mining camp by outsiders, but it is not. There would be hundreds of men at work in the placers to-day if the water supply was sufficient on ground that would pay from $10 to $15 per day to the hand. A ditch of only 8 or 9 miles in length would have to be run to take in an abundant supply, and we cannot see why it is that the miners there do not club together and bring in one. It would be through easy ground, and, by doing the work themselves, the expense would not be great. Besides the placer there are a great many quartz ledges carrying gold and silver, but no attention has been paid to them, except by Mr. Ell Chase, who located two or three of them during the summer, and had some of the ore from one of them assayed, which showed $1,000 to the ton in gold. We visited that section three months ago, and were very favorably impressed with the appearance of the country, and with the formations. That there are a large number of good gold mines is evident from the amount of float found all over the hills, and the time will come when Stanley basin will be numbered among the best mining districts of the Territory.

MONTANA.

ANOTHER RIVER-BED FULL OF NUGGETS.—Helena *Independent*: It appears that the Gravely range gives promise of turning out something that bids fair to rival Col. Keeler's famous ancient river bed bonanza below Helena. It is claimed there is a channel of an ancient river on the summit of the Belt range, and that from this came the fabulous wealth of Confederate gulch, Montana bar, Montana and Cement gulches. Although no pay streak has yet been developed on this range, much prospecting has been done and some gold found. A number of shafts have been sunk, some of which have prospected well, but as in the case of Col. Keeler's prospect shafts, the water was too plenty to allow of thorough development. A tunnel was run into the side of the rangs to afford drainage, but after getting in 500 ft and before reaching the channel, the men engaged on it had to stop for want of means to go farther. This was done several years ago, since which time it has lain idle. Preparations are now being made to develop the channel, and if there is any treasure hidden there to bring it to light.

NEW MEXICO.

PINOS ALTOS.—*News and Press*, Dec. 17: Reduction works are talked of in the Pinos Altos district, Grant county. The ores are rich and abundant.

BESSIE.—Work on the Bessie mine in Mora county has been resumed. The ore shows indications of silver, with plenty of copper. A whim has just been erected.

SMELTER.—Two Colorado men are to put up a 1-ton smelter in Water Canyon district near Socorro, to test the ores to see if it is of sufficient high-grade to warrant the erection of a smelter.

MILL.—The mill at the Santa Rita Co's. mines in Grant county, will start up about the first of February. The machinery is still being received, and by the time the structure is completed will be all on the ground ready for erection. The ore on the dump is now awaiting treatment is full of native copper, and a mill test will show a very high per cent of that metal.

SOCORRO is fast becoming the mining center of New Mexico. Sales of mining properties in the neighborhood of town are continually being reported. A custom stamp mill and smelter is in full operation, and side tracks are now being built to the works, and a big scale put in. The mill of the Torrence mine started up this week, with an abundance of good ore on the dump, and a large force is taking out rich ore. It is reported that another 20-stamp mill will be erected on the Merritt mine, and the Socorro Tunnel Co. will erect one on their properties.

WHITE OAKS.—Development is steadily going forward in the White Oaks mines. Machinery for the Homestake stamp mill is now on the ground and being placed in position. Mr. Hodgmann, who has charge of the work, claims to have made several valuable inventions while he has been in the Oaks, which will reduce the cost of, and loss in amalgamating. Practical men vote it a success. The Little Nell has a tunnel 200 ft long. The outlook is good. The Little Mac is the bonanza of the camp. Work is now in 200 ft, with free gold showing in all the veins. It is estimated that there are over 50,000 tons of ore in sight, which at the mill run test would give over a million dollars profit.

NATIVE SILVER.—Another rich strike of native silver has been made near Silver City. The discovery was made by J. H. Carroll, near Price's ranch on the west side of the Gila river in Grant county, and Carroll, W. F. Clarke and James Corbin are the owners of the mine. A shaft sunk to the depth of a few feet disclosed a three-foot vein, supposed to be a true fissure. The mine produces a dark, red quartz, in which native silver is found in nuggets or balls, varying in size from minute particles to that of a walnut. When the ore is broken, these round nuggets become detached from the rock and fall out like bullets. The ore tested will go fully $8,000 to the ton. Several other discoveries nearly or quite as rich have been made in that neighborhood, native silver as pure as if from a furnace being produced.

OREGON.

MYRICK'S MILL.—*Bedrock Democrat*, Dec. 14: Capt Myrick's quartz mill is crushing steadily on a large quantity of high-grade ore, and we expect soon to hear of a big clean-up from that quarter.

UTAH.

CARBONATE.—Southern Utah *Times*, Dec. 20: But little work is now being done on the Carbonate mine. The Carbonate Concentrator shut down temporarily on Tuesday.

CHARLOTTE.—*Southern Utah Times*, Dec. 17: The Charlotte mining claim, located about one mile northwest from Frisco, at a depth of 22 ft contains a vein of ore 15 inches wide, which very much resembles Horn Silver ore. This claim is worth prospecting.

LULU.—In company with Supt. Ryan, we visited the Lulu mine on Thursday. This mine is situated immediately south of, and adjoining the Horn Silver. The Lulu is an incorporated property, and is owned by Messrs. Culleo and Ryan of Horn Silver fortune, and a number of capitalists in the city of Chicago. The mine is being developed by sinking a shaft about 100 ft east of the footwall. The shaft is now down about 200 ft. We understand it to be the intention of the company to keep on sinking until in their judgment the proper depth has been reached from which to drift toward the hanging wall. The character of the formation, the footwall of which is the same as that of the Horn Silver, and has the same dip, all point to the fact that deep down there lies buried a large body of rich ore. The striking of a rich body of ore in the Lulu will mark a bright epoch for the people of Frisco.

SILVER REEF.—*Miner*, Dec. 16: Having now entered upon the last month of the closing year, the time will soon be at hand when the balance sheet and annual exhibit will be forthcoming, to show the accumulated product of the precious metals from this district. For 5 years a steady stream of bullion has poured into the marts of commerce, and helped to swell the nation's wealth. Although unforeseen causes interrupted in part the operations at the mines for a considerable portion of the year, the showing will nevertheless, we predict, be of the most satisfactory character to all concerned. As this writing the mills and mines are all running to their full capacity and demand, and the prospects are most flattering for the future.

GOLD BASIN.—From Gold Basin, which is now looming into prominence, we receive the most encouraging reports. The first 24 hours' run of the mill of that district—succeeding the clean-up reported previously—15 tons of free milling gold ore was treated, yielding $48 to the ton. There is an abundance of this ore upon the mill dump at present, as well as several hundred tons of much higher grade awaiting treatment.

MINERAL PARK.—The Lone Star, Keystone and several other of the mines of this district are producing good milling ore, which is being worked at the Lone Star mill. The outlook is very encouraging for a new lease of prosperity for this long-neglected camp.

CREAT.—The mill repairs have just been completed and the company have resumed operations. The mines of the vicinity at no time looked more promising or yielded better than at present.

GRAND GULCH.—Late advices from this district leave no doubt but that the problem of reducing the rebellious copper ores has been satisfactorily overcome. The two smelters at the mines are being run to their full capacity, and more are in course of erection. The Messrs. Adams are to be congratulated on their persistence and success

---

SETTLERS are coming in numerously along the line of the California Southern railroad, in San Diego county, and are taking up every available piece of land that can be obtained,

The Yield of Wood River Mines Last Season.

For weeks past the *Times* has endeavored to procure accurate reports of the ore and bullion shipments from the Wood River country during the past season, but its efforts have been met with only partial success. Enough has been ascertained, however, to warrant the statement that during the seven months ending on the 1st inst., over $1,000,000 worth of bullion and ore was shipped out of the Wood River country. The exact figures will be published when received. At present only approximate amounts can be stated.

Shipments from Bullion.

The bulk of the ore from this camp was probably shipped to Hailey, thence transhipped for Blackfoot or Kelton, where it was loaded on cars and taken to Salt Lake. The report includes all shipments during the season beginning May 9th and ending Nov. 30th.

The Mayflower shipped 970 tons carrying 175 ozs. silver and 70% lead per ton.

The Bullion shipped 415 tons carrying 225 ozs. silver and 50% lead per ton.

The Jay Gould shipped 375 tons carrying 120 ozs. and 65%.

The Eureka shipped 74 tons, carrying 100 ozs. and 65%, lead per ton.

The Homesteke shipped 12 tons, carrying 140 ozs. and 55%.

The O. K. shipped 2¼ tone, carrying 175 ozs. and 70% lead.

The Champion.

The Idahoan, according to the reports furnished, is entitled to the first place in the list of local ore-producers. During the past season it shipped 1,000 tons of ore averaging 150 ozs. silver and 75 to 81% lead. There remain on the dump 800 tons of ore half of which assaye from $130.58 to $3,100, besides carrying from 50 to 70% of lead; the other half will yield, clear of all expenses, $53.60. The yield of the Idahoan the past season has exceeded $200,000.

From Hailey.

The Star mine shipped ore that eold for $37,500.

The Ophir, Emma Fair, Japan, Bon Ton, Washington, Narrow Gauge, French, and other groups and mines also shipped ore, hut the figures are not known.

The local smelter shipped abont $75,000 worth of hullion.

From Ketchum.

The Philadelphia company shipped $32,000 wortb of hnllion, the result of a hricf trial run.

The Carrie Leonard shipped 38 tons, averaging 200 ozs. in silver.

The Rooks, Black Horse and Allen shipped 30 tone each, which averaged 144, 144 and 130 ozs., respectively.

The Connors shipped 25 tons, carrying 120 ozs.

The Elkhorn shipped 600 tons, which averaged 120 ozs. silver.

From the Vieuna and Mountain King mines, ahout 30 tons of fair milling ore were shipped to Ketchum, thence to Salt Leke. They yielded 271 ozs. per ton.

Mr. Smiley also shipped some ore to Salt Lake, hut the figures have not heen obtained.

The total shipment from Ketchnm will probably aggregate 500 tons, carrying an average of 130 ozs. silver.

Shipmente from Bellevue.

From Bellevue reports of the shipment of 281 tons have heen received. These are as follows:

Minnie Moore mine, 217 tons, averaging 101.62 ozs. silver and 67% lead.

Monday, 5 tons, averaging 622.70 ozs. silver and 54% lead.

Overland, 14 tons, avereging 99.16 ozs. silver and 70% lead.

Queen Victoria, 34 tons, averaging 137.43 ozs. silver and 64% lead.

Mammoth, 5 tons, averaging 92 ozs. silver and 67% lead.

Morton, 6 tons, averaging 152 ozs. silver and 68% lead.

Besides the ahove mentioned, the Queen of the Hills and five other mines shipped ore, but no reports have heen received hy the *Times*.

A Curious Case.—The Virginia *Enterprise* records the following extraordinary case: It now appears prohahle that James Rowe, who was so fearfully injured hy the explosion in the Forman shaft, will get well. Both of his arms have heen amputated and the sight of hoth eyes appears to he gone. His hody was perforated in hundreds of places hy small pieces of rock, yet with all this the man is steadily improving. The fragments of rock hlown into the man's hody have not heen dug out with instrnments, hnt have heen left to work out of themselves, and daily pieces of gravel are coming to the surface in one place or another. Mr. Rowe doee not yet know that hoth hands are gone. He etill thinke he has one arm left. Yesterday, Dr. Wehher, County Phyeician, asked him if he would not like to change his position and rest on his eide for a time. He said he would like it very much; "hut," eaid bo, "you know, Doctor, that I must he very careful of the arm and hand left me. I am afraid that shonld I change my position, it would hring a etrain on that arm before it is sufficiently strong to bear it." The Doctor had not the heart to tell the man that he was armless, and only eaid: "Very well, Jemmy, make yonrself ae comfortahle ae you can, and whenever you feel like heiug turned let me know."

Iron Ore in Shasta and Other Counties.

Of all the nndeveloped resources of this State none have heen eo entirely overlooked and neglected as the iron interests. It was not until recently that the least attention was paid to the subject, and even now, ontside of a few local pepers and one or two of the San Francisco dailies, the matter is not mentioned. Puhlic attention, even in the conntiee where valuahle deposits of iron are known to exist, have not attracted that investment of cepital necessary to the development of the mines. Notwithstanding this indifference regarding what is sure to he one of the leading interests of the State in the near future, at least five of the mountain counties contain deposite of iron equal in quality to the richest ores of Pennsylvania and New York—Calaveras, Tuolumne, Placer and Shasta. In relation to the supply we cannot speak with any certainty as to other counties, hut in Shasta all the indications lead to the helief that it is inexhaustible. Shasta, alone of the counties known to contain iron, produces the hlack oxide, or what is more popularly known as magnetic ore; deposits in the others consiet wholly of the hydrated oxide of iron, a qnality of ore nsually oalled' hrown hematite. The difference hetween the oree is that the magnetic is richer, and is usually made directly into wronght iron in forges, while the hematite is mannfactured into pig.

The immense iron heds owned hy J. B. Potter, Avery, Gov. Stanford, and others, eituated near the McClond river, at the site of the old Silverthorn hridge, and secnred hy government title, are extensive enongh to justify the employment of heavy capital in working them. Iron monntain ie known to contain conntless millions of tons of the finest quality of iron ore, and our local hlacksmiths have repeatedly heated epecimens of it in their forges and hammered it into varions implements. With an ahundance of snch ore and a plentifnl supply of wood for coaling purposes, and excellent sites for furnaces ohtainahle, what better facilities for the profitahle manufacture of iron on a large scale can he asked for? As the deposits specially mentioned will be quite near the line of the railroad, we may reasonahly expect that they will not he allowed to remain idle very much longer.—*Shasta Courier.*

The Hydraulic Pumps on the Comstock.

The work of laying the 12-inch supply pipe from the big reservoir on the side of Mount Davidson to the hydranlic pump of the Chollar-Norcross Savage shaft bas been commenced. The pipe will he in place by the 1st of next month. The hig pump will then he rnn hy the natural pressnre of water flowing through the supply pipe. There will then he no nse for the surface engine, by means of which a powerful pressure is brought to hear npon the vertical column of water in the present supply pipe, and whioh not only operates the pumping apparatus down at the 2400 level, but also hringa to the surface (through an exhaust pipe) a stream of water enfficient to feed the snpply pipe.

The present hight of the supply pipe from the pumping apparatus to the surface is 2,400. When the pipe now heing laid from the reservoir ie connected with this it will give an additional pressure of 440 ft.; that is, the pressure in tbe snpply pipe will then he equal to that of a column of water of the vertical hight of 2,840 ft. In no place in the world ie a hydraulic pump running nnder the pressure of a column of water of such great hight.

When the pnmps are run hy means of a natnral flow and pressure of water it will no longer he necessary to hring any water to the surface. What is now the exhaust pipe will thsn be cut off at the Sntro tunnel level and two pipes will then he constantly discharging at that point. When they begin working hy the new plan they will have the water entering the pumping apparatns through a pipe 2,840 ft. in hight and discharging through one hnt 800 ft. in hight; therefore there will be gained the moving force of a column of water 2,040 ft. in hight.

Rich Strikes in Arizona.—Two very rich strikes were made at Mineral Hill yesterday, one in the Wedge mine of the Chollar group, helonging to Miller & Sihhad, and the other on the Specie-Paying, the property of the Indiana company. In the Wedge mine the strike consists of a 5-ft. streak of very rich horn silver-bearing rock. In the Specie-Paying the etrike was mede in an open cut on the north end of the claim, ahout 200 ft. from the south end of the Alice mine. The ledge, which was 30 ft. wide at this point, was cnt into 4 ft., and showed masses of horn silver the entire distance. The ore will mill $80 per ton, and will work up to 90% hy the ordinary milling process. These strikes are cansing mnch excitement here.

The Gold Hill mining company at Grase Valley has applied for a patent to its ground. Thie wae the first ground located for quartz mining in that district, in the year 1850, and in all prohahility the firet claim located for that purpose in the State, ae Gold Hill was the scene of the firet qnartz operatione in California.

Tombstone ie now experiencing more prosperone timee than it has ever known hefore. One cause ie that the people have at last come to the conclusion that the lawe mnst he oheyed, and that life and property mnst he protected. All who think differently will have to etand from nnder.

Mining Frauds.

There must he a very disgraceful eystem of "chenanigan" heing practiced in the stock hoards of New York in the branches specially connected with mining operations. At least, it would seem so from the tone of the mining press of that city. The *American Exchange* says, without attempting at the moment to pick ont isolated cases, or to fix the responeihility for the series of lossee which for the last year have fallen npon the people of the East, who were crednlous enough to credit the professione of those Western persons who wanted to make mining as stahle and as legitimate an interest as agriculture, we do say that the term "disgracefnl" is not too severe a term to apply to the many maltreatments and mismanagements of mining propertiee which have become a reproach to everyone who has had the success of the mining indnstry at heart.

There must he some change in tbe way of managing mining companies; there mnst he provided hetter safegnards for the protection of investors; there must he devised some system by which officere and directore of mining companies will not eo readily he made the tools hy which scamps can so outrageously hoodwink and roh the public.

Something shonld he done in this direction, and that speedily. A fraud is a fraud whether perpetrated in a commercial, agricultnral or mining transaction. Who will swindle in the one ie restrained hy no conscientious scrnples to *rob* in the other, or, if need he, upon the highway.

The man or men who will fraudulently mierepresent the outlook or prospective productiveness of mines is no hetter than one who will put his hand in your pocket and filch therefrom whatever little coin may he found floating in its cepacious reoesses. What is called in mining parlance, manipulation, in common and recognized English, means thieving. To declare dividende when no such results follow in fact is only to ohtain "money under false pretensee." If nnder certain circnmstancss this kind of "manipulation" sends the manipulator to the Stete or Territorial penitentiary we fail to see why, perpetrated under similar conditions but in the prosecution of another character of villeny the same penalty ehonld not attach. The trnstees or directore of a mine or mining corporation who declare a dividend of one per cent upon a capitel stock of $10,000,000 with no deposit of ore taken from the mine, and npon this representation puts the stock upon the market and imposes it upon the puhlic as dividend-paying, are not a whit less rescals and rohhers than the masked villiane who demand your purse or your life on the highway. They should he punished accordingly. Misrepresentation of a mine is no lese nefarious than tbat of a house or a horse and whoever ohtains money or other valuahles hy fraudulsnt misrepresentations in one case is no less a thief than he who ohtains it in the other.—*Arizona Journal.*

A New Variety of Glass—A Vienna chemist has recently discovered a new variety of glass. It does not contain any eilica, horic acid, potash, soda, lime, or lead, and ie likely to attract the attention of all professional persons on account of its peculiar composition. Externally it ie exactly similar to glass, hut its luster ie higher and it has a greater refraction, of equal hardness, perfectly white, clear, transparent, can he grounnd nnd polished, completely insoluhle in water, neutral, and it is only attacked hy hydrochloric or nitric acid, and is not affected hy hydrofinoric acid. It ie easily fnsihle in the flame of a candle, and can he made of any color. Its most important property is that it can he readily fnsed on to zinc, hrass and iron. It can also he nsed for the glazing of articles of glass and porcelain. As hydrofinoric acid has no effect on the new glass it is likely to find employment for many technical purposes.—*Wiener Gewerbe Zeitung.*

Slip in Belts.—From experiments made it has heen ascertained that ahout two revolutions per hundred are lost in the transmission of motion hy a helt. In ordinary practice this would he a elight loss, and would in no wise interfere with the nsnal manufacturing processes; hnt, where there ie a long train of gear repeated from shaft to shaft hy helts, the loss hecomes serious. It ie clear that if the coefficient of loss hy slippage he .98 for a single pair, which has heen verified with great certainty hy varying the tensions of the same helt, it will become equal to the euccessive powers: 98, 96, 94, 92, 90, and so on; so that after a succession of five speeds, the loss amonnts to one-tenth of the calculated epeed, and at the end of 34 epeeds the velocity will he redneed to half. From these considerations it appeare that where it is required to transmit epeeds as near determinats as may he, hy means of hands and pulleys, it is necessary to increaee the diameter of the driving pulley hy its fiftieth part, or diminish the driving pulley in the eame ratio.

John Catalow, who is largely intereeted in the South Mountain mines, eays the Winnemucca *Silver State*, informe ne that the furnacee are running eteadily and tnrning ont ahont eix tone of hnllion daily. Last Satnrday 600 hars, averaging ahont 100 lbs. each, had heen smelted, and a part of it shipped to thie place. The hars contain from $25 to $30 each in eilver, or from $500 to $600 per ton. No tronhle whatever was experienced hy the Eureka men, who have charge of the furnace, in emelting the ore.

The Mode of Working the Morey Ores.

The following is an extract from a letter received hy Dr. J. A. Stites, of Belmont, written at Morey, Nye county, Nevada: "In your last you expressed a wish to know something of our mode of working the Morey ores. While I have neither time nor space to go into details, I will hriefly state the most important points: The ores of this district are moetly a heavy antimonial sulphide, in some cases carrying as high as 50% antimony, while the average is ahout 20%. This ore we treat in the following manner: It is first screened eo ae to separate the dust and fine perticles. The coareer part ie then put up and hurned in pits, eimilar to charcoal pits. It takee from six to eight weeks to hurn one of those pits, and so heavily is the ore charged with enlphur that three cords of wood will thoroughly ignite 60 to 70 tons. This ore when burned is ready for the mill, and, with careful handling, I have worked it up to 90% on an average. The screenings, or fine particles, cannot he treated in this, as they are too fine to hnrn, hut hy passing them through the furnace as they come from the mine we manage to get rid of the sulphnr; it is then pessed through the hattery and treated in the usual way. The furnace is one of the original White's and is now well adapted for handling this kind of ores, hut I have improved and changed it so that it does its work well, and I am satisfied that no other mill in the State can ehow ae good resnlts on a similar character of ore. Parties here are satisfied that the problem has heen solved, and the future of Morey never did look so hright as now. The company are indehted to A. McArthur, hy whose energy and skill as foreman their mines have heen placed on a paying hasis."

An Expanding Mandrel.—An expanding mandrel recently introdnced consists of two parts, viz.: a rihhed split sleeve and the mandrel proper. The sleeve, which is made of steel, is pierced with a tapering hole, and one end of the mandrel is turned to exactly fit this hole. The sleeve is then turned to the required diameter, preferably on the mandrel to which it helongs, after which the material is removed in such a way as to leave three narrow longitudinal hearings with equal depressed epaces hetween them. These depressions extend very nearly to the hore of the eleeve, leaving only sufficient metal to hold the hearings in position. The sleeve is cut apart through one of these depressions, leaving it free to contract or expand. In using this mandrel, the eleeve is placed in the hole, where, hy lightly driving the mandrel into it, expansion will occur, and the three bearing surfacss will he forced into eufficient oontact. The contrivance is simple in construction, can he readily and inexpensively made as required for nse in a machine shop, end can also he advantageonsly manufactured and sold as a standard tool.

We learn that Col. T. G. Bilty and John Mnhlhach, of Greenwood, have just hrought ahout the sele of three quartz claims at Fraser Flat to an Eestern company, the price heing $50,000. Five tons of the quartz are being tested this week at the Cal. W. & M. Co.'e mill, and parties who hnve prospected the rock inform ns that it is quite rich. A 20-stamp mill ie to he erected upon the new consolidated mine right away. We also learn that the same parties have negotiatcd for the sale of the Wildwood mine, ahont two miles east of Georgetown, to the same company, for $6,000. Mr. Bilty has large experience as a mining expert, and appears to possess considerahle influence with capitalists seeking investment in good mines.—*Georgetown Gazette.*

Found it out by Experience.—One of the etrongest arguments that can he presented against the cheapnese of Chinese lahor, ie the experience of the Bald Mountain drift mining compeny, who several yeare ago made some experiments in this direction. They kept careful record of the results of employing the Mongolians, and in a short time hecame thoroughly satisfied that Chinese miners were expensive institntions to have around. Since that time the nnwritten motto of the company has heen, "No Chinese Need Apply."—*Sierra County Tribune.*

Niter Company.—Governor Kinkead, James Crawford, T. R. Hofer, G. G. Lyon, S. H. Day, A. Hehherling, J. M. Hetrich, and others, have taken up 3,000 acres of niter land in thie State, and have interested eome New York capitalists in the prospecting of that property. It is nnderstood that refining works will he erected on the land at an early day. Governor Kinkead is President, and T. R. Hofer ie Secretary and Treasurer of the company.—*Eureka Sentinel.*

The Otto Gas Engines at Paris.—In the distrihntion of awards at the exhihition of electricity, in Paris, the Otto motor received a gold medal, the highest award given to machines of this clase. As an indication of the succese of these motore, it is said that over 7,000 of them have been put in operation during the past four years.

Many men hnrned in the minee hy the explosion of gae owe their deathe to the fact that they have pereisted in working without any ehirte or other protection for their hodiee eave pantaloone.

Thirty-nine loads of ore, eetimated to he worth $200 a load, from the Ford & Mnllen mine at Grase Valley, are heing milled. Eleven men and hoye extracted it in two monthe.

The Engineer.

A Canal Boat Propelled by Air.—A novelty in canal boats has recently heen constructed at Wiscasset, Me., after designs devised by the owner, Mr. R. H. Tucker of Boston, who claims to hold patents for the design in both the United States and England. The first boat built is now lying at the month of Charles river, Boston, where it has been examined with much interest by engineers and others. This boat is designed to be used on canals without injuring the banks; it is a simple structure, measuring 62 ft. long and 20 ft. wide. It is 3 ft. in depth and draws 17 inches of water. It is driven entirely by air, a Roots blower No. 4 being used, the latter operated by an 8-horse-power engine. The air is forced down a central shaft to the bottom, where it is deflected, and, being confined between keels, passes backward and upward, escaping at the stern through an orifice 19 ft. wide, so as to form a sort of air wedge between the boat and the surface of the water. The force with which the air strikes the water is what propels it. The boat has a speed of four miles an hour, but requires a 35 horse-power engine to develop its full capabilities. The patentee claims a great advantage in doing away with the heavy machinery of screws and side wheels, and believes that the contrivance gives full results in proportion to the power employed. It is also contrived for backing and steering by air propulsion.—*Boston Journal.*

Society of Mechanical Engineers.—The last annual meeting of the American Society of Mechanical Engineers was well attended, and the papers presented, though not large in number, were of considerable interest and importance. The *American Manufacturer* indulges in the following criticism upon them: "If the papers read were shorter and more to the point than most of them were they would be more widely published, more universally read and more easily understood. Hence, they would accomplish more good then such papers now accomplish, and their authors would reap just as much glory, if not a little more, although many of them appear to think differently, judging from the length of their papers. They do not appear to realize that life is short, that most men at this age of the world have at best more to do than they can get through with comfortably, and that what may afford gratification to themselves may, on account of its verbosity, be a bore to others." It may be remarked that the discussions upon the papers were necessarily somewhat limited on account of the short time which the Society had at its disposal. The press of business felt by most mechanical establishments at the East at the present time no doubt kept many away and deterred others from the preparation of valuable papers. The next session will be held at Philadelphia.

Experimental Shipbuilding.—M. Raoul Pictet lately read a paper before the Paris Academy of Sciences upon the scientific principles by which the speed of vessels might be considerably increased. M. Pictet, having studied the question of producing a vessel to transport a given weight with the greatest economy and speed, has arrived at the idea of constructing one that shall be comparatively broad and shallow. The bottom will receive a constant upward pressure, which M. Pictet believes will tend to decrease the draft in proportion as the speed increases. His calculations show that with a vessel constructed on this principle a speed of from 35 to 40 miles an hour should be attained. A experimental boat has been ordered from a firm in Geneva, and is expected to be tested on March 1st of next year. *La Nature* considers that M. Pictet's former work is a guarantee that this time, too, his experiments will prove of practical value. It is to be borne in mind, however, that this is a very old idea, and unless M. Pictet's plans include special features, which are as yet unknown to us, we fear that his experiments will only result in disappointment.

Naval and Submarine Engineering Exhibition.—An international exhibition of naval and submarine engineering appliances is announced to be held in London, in April, 1882. It is intended to cover the wide field occupied in the production of machinery and mechanical contrivances employed in shipping, harbors, etc. Prizes are to be given for the best means of saving life in case of shipwreck, and for the best invention of a humane character connected with sea-faring matters.

Tunnel Under the Severn.—It is announced that, after some seven years' labor, the tunnel under the Severn has at last practically been made. The workmen are said to have met in the middle of the channel, and joined the two paths of communication from the English and Welch sides; so that, unless some most unlikely interruption or disaster should now occur, there remains nothing but to enlarge the passage, wall it in and lay the lines of rail.

New Bridge over the St. Lawrence.—Surveys and soundings for a new railway bridge over the St. Lawrence river, west of the Victoria bridge, are being pushed forward rapidly. The engineer-in-chief hopes to make his report as to the site in a few days to the directors of the Atlantic and Northwest railway.

Useful Information.

The Difference Between a Cyclone and a Tornado.

The difference between a cyclone and a tornado is defined by Mr. William Ferrie, of the United States Coast Survey, to be this: A cyclone is usually a broad, flat, gyrating disc of atmosphere, very much greater in width than altitude; a tornado is a column of gyrating air, the altitude of which is several times greater than its diameter. Cyclones are born of conditions extending over large areas; tornadoes depend rather upon the vertical relations of the atmosphere, and occur when, owing to local changes of temperature, the under strata of air burst up through the overlaying strata. The enormous velocities of the ascending currents of tornadoes are supposed to be caused by the difference between the gyrating velocities above and those on the surface. It is these ascending currents which carry up the vast bodies of water afterward precipitated in the form of a deluge of rain. The water is sometimes kept from falling by the ascending currents, and is often projected outside the area of the tornado, when it falls in a gentle shower over a larger area. When the weight of the water overbears the force of the ascending currents, there occurs the tremendous fall of rain known as a cloud-burst. When the area of a tornado is very small, a land-spout or a water-spout may be formed, according as it is over land or water. The width of these spouts ranges between 2 ft. and 200, and their hight from 30 to 1,500 ft. A white squall is an invisible spout, formed when the dew point is low. The accompanying cloud is invisible because of its hight, but below there is a raging and boiling sea, with a gyrating current of air above it. Land-spouts and water-spouts are hollow.

Effect of Sunshine.—From an acorn, weighing a few grains, a tree will grow for 100 years or more, not only throwing off many pounds of leavee every year, but itself weighing several tons. If an orange twig is put in a large box of earth, and that earth is weighed when the twig becomes a tree, bearing luscious fruit, there will be very nearly the same amount of earth. From careful experiments made by different scientific men, it is an ascertained fact that a very large part of the growth of a tree is derived from the sun, from the air, and from the water, and a very little from the earth; and notably all vegetation becomes sickly unless it is freely exposed to sunshine. Wood and coal are but condensed sunshine, which contains, three important elements equally essential to both vegetation and animal life—magnesia, lime, and iron. It is the iron in the blood which gives it its sparkling red color and its strength. It is the lime in the bones which gives them the durability necessary to bodily vigor, while the magnesia is important to all of the tissues. Thus it is, that the more persons are out of doors, the more healthy and vigorous they are, and the longer they will live. Every human being ought to have an hour or two of sunshine at noon in winter, and in the early forenoon in summer.

A New Patent Boot Heel Protector.—Mr. M. D. Williams, Syracuse, N. Y., has invented a new patent metallic boot-heel protector. This protector is made of brass or light steel and is fastened around the outer edge of the heel with three screws. It is about one-half an inch in hight, and protects the bottom of the heel by a narrow flange, which operates to keep the heel from wearing away at the edges, and at the same time gives strength and stability to it. The protector being very light adds but little to the weight of the boot, and, what is usual in like inventions, it does not detract from the finish or good appearance of the boot. This improvement is comparatively inexpensive, and the manufacturer who may be fortunate enough to obtain control of the patent ought to realize a handsome fortune out of it.

Carbonized Bran for Fruit Packing.—The California Fruit Shipping Co., of Vacaville, in this State, furnishes the following information in reply to a query from an Eastern paper: "Carbonized Bran" is made from ordinary wheat bran burned in a retort, under which treatment all moisture is driven off and a species of charcoal is obtained. This coal bran is used in packing green fruits for long shipment, and the patentees claim that grapes, when thus packed, may be shipped from this coast to Eastern markets by slow freight with safety, thus avoiding the high charges on fast freight. The company claims that tomatoes have been kept for six weeks when packed in this bran. It is stated that peaches will keep twice as long as under ordinary conditions, but this fruit having a porous skin is not as well preserved as other fruits.

To Bend a Wrought Iron Pipe.—Fill it with melted resin. When the resin hardens bend the pipe, and it will retain its round form. Remove the resin by heating.

Immense Mirrors.—There have been set up in the Grand Opera House at Paris a number of mirrors, measuring 45x52 ft., and weighing from 1,200 to 1,600 lbs.

Fires from Steam-Heating Pipes.

Steam pipes cause fires in two ways: first, by assisting spontaneous combustion of oily fiber, and, secondly, by very slow carbonization of wood at a low temperature which will ignite at a slightly higher temperature. It is a well-known fact in chemistry that the temperature at which charcoal will take fire varies with the temperature at which it is made. The extremely low temperature at which some forms of carbon will ignite is shown by the familiar experiment of burning tinder in a close glass tube fitted with a piston; the heat developed by the condensed air, when the piston is forced down, being sufficient to ignite the tinder.

The writer has seen charcoal ignited by the heat of a horizontal flue which was cool enough to serve for a walk. Steam pipes must be kept clear of combustible material of all kinds and nature. In passing through hollow walls and floors, the pipe should be surrounded by a sleeve made of larger pipe—large enough to leave a free air space between the steam pipe and the outer pipe. Rats are prone to make their nests around steam pipes in such concealed spaces. The necessity for all excessive espionage can be saved, available area added to the mill, and all portions of the mill containing machinery can be more uniformly and economically warmed by elevating the steam pipes, running them around the rooms about two feet from the walls and ceiling, the lines of pipe lying side by side in a horizontal plane. The use of elevated steam heating pipes in rooms without operating machinery, has not been sufficiently general to warrant any decided opinion in the matter. Some rag rooms in paper mills and sorting rooms in woolen mills have been fitted with overhead steam pipes, and they have proved satisfactory. In one instance a rag room has been so heated for six years. In short, the practical results of elevating steam-heating pipes and moving them away from the walls have been of such a favorable nature that the writer never knew of such pipes being moved back to the usual position near the floor.—*Iron.*

Bronzing Copper.—At the Paris mint medals are bronzed by boiling them for a quarter of an hour in the following solution: pulverized verdigris, 500 grammes; pulverized sal-ammoniac, 475 grammes; strong vinegar, 160 grammes; water, two liters. An untinned copper boiler is used, and the medals are separated from each other by bits of glass or wood.

Stove Blacking.—The most lasting polish is obtained by first brushing the stove with a syrupy mixture of lamphlack and soluble glass, and letting dry for twenty-four hours. Then apply a syrupy mixture of blacklead and mucilage, and polish by brushing before the last coat dries.

Good Health.

Talk at Dinner.

The English medical paper, the *Lancet*, has had a pertinent article on Fast Eating, and this article has gone the round of the American papers, so that the public shall benefit by it. Who does not know that fast eating is a bad practice, and who does not practice it all the same? The greatest sinners in this respect are the commercial men, who can be seen in shoals in commercial quarters, gulping down their dinners and luncheons, crying "check," then rushing off with the last morsel sticking in their throats, or perhaps the final crust between their fingers, to be finished in the street.

All things have their time, so has eating and drinking. Could man or woman turn their vision within and see how that poor misused organ, the stomach, wriggles and contorts before it can accommodate itself to the mass that is thrown into it, man or women would have pity upon it and begin to reflect that the course pursued was not the right one.

People who eat fast should order their coffins, insure their lives for the benefit of their families and never start on hazardous journeys. It may be their last. More apoplectic fits are brought on by fast eating than by anything else; more indigestion and dyspepsia is the result of rushing down the food than of the food itself; more constipation is brought about by holding meals than by the meals themselves.

Eat leisurely and you will enjoy the benefit of what you have eaten. Rather do not eat at all than eat fast, for hunger will not injure you as much as fast eating.—*Food and Health.*

Malaria.—Of all the diseases with which mankind is afflicted, perhaps not one is less understood and more vaguely defined than malaria. All professional opinions in regard to it are chiefly theoretical, and the opinions which are contained in a little treatise on malaria, written by Joseph F. Edwards, M. D., form no exception to the rule. But the author frankly acknowledges that his theory should not be accepted unless it can be rigidly verified by ample proof educed in the future. He claims, however, that, irrespective of his theory, what he says will be the means of enabling the reader "to avoid very much of the suffering which is directly or indirectly traceable to malaria," and the common-sense manner in which he handles the subject shows that he has not overrated his claims. He says that the word malaria is derived from the two words *mal aria—bad air,* and he closely conforms his arguments and statements to this definition, thereby avoiding much confusion and vagueness. He says that the principal cause of malaria is organic decomposition, and maintains that "the surest way to avoid malaria is to remove this matter from your presence while it is undergoing decomposition." In other words, he believes an ounce of prevention is worth a pound of cure. The book is written in a plain and popular style, well-adapted to the understanding of non-professional readers.

Bread from Bark.

It is well known to the botanists that many plants besides those commonly used for food, contain nutritive elements. Nearly all plants contain starch. The barks of several aspens and pine trees contain so much of this substance that it can be extracted from them as from potatoes by trituration with water. It exists also in the roots and other parts of perennial plants to such an extent as to have been employed in the preparation of bread in families. In illustration of this we quote the following directions, given by Professor Autenrieth, for preparing a palatable and nutritious bread from the beech and other woods destitute of turpentine: "Everything soluble in water is first removed by frequent maceration and boiling; the wood is then to be reduced to a minute division, not merely into fine fibers, but actual powder; and after being repeatedly subjected to heat in an oven, is ground in the usual manner of corn. Wood thus prepared, according to the author, acquires the smell and taste of corn flour. It is, however never quite white. It agrees with corn flour in not fermenting without the addition of leaven, and in this case some leaven of corn flour is found to answer best. With this it makes a perfectly uniform and spongy bread, and when it is thoroughly baked and has much crust, it has a much better taste of bread than what in time of scarcity is prepared from the bran and husks of corn. Wood flour also, boiled in water, forms a thick, tough, trembling jelly, which is very nutritious."

The Sanitary Science of the Pentateuch. A writer in the *Journal of Science* thinks that the knowledge of sanitary science possessed by Moses was in advance of that of today. He says: "So peculiar is human progress that it has taken 3,000 years to bring the civilized world to a point less advanced than that occupied by Moses. Less advanced we say, emphatically, because if we now admit the value of personal cleanliness, the importance of avoiding putrescent and loathsome matters, and of expelling them rapidly from our cities, and if we are theoretically aware of the disinfecting and deodorizing power of earth, we are far from embodying this, our knowledge, in the practice of actual life. As to the avoidance of blood of the flesh of foul-feeding animals, and of such as are liable to introduce entozoa into our systems, we do not recognize even verbally the importance of the Mosaic teachings. We eat 'blood puddings,' we feed swine with blood and with foul-smelling offal, and then we eat the animals which have been gorged on this revolting diet. And we pay the price of this uncleanliness in shortened lives and in waning vigor. We again call attention to the remarkable physiological insight displayed in the sanitary code of the ancient Israelites, and we repeat the question, Whence did it spring?"

Unwholesome Sleeping Rooms.—In many houses bed-rooms about seven by nine ft. in size, or not much larger, are found, in which two persons are often expected to sleep, and that too, sometimes, with closed window and closed door. If the carpenter who finished the room had been an extra good workman and had made the room pretty near air-tight, the two lodgers, or the one, who went to bed in one of these closed rooms at night would afford the undertaker a job next morning. These small, close bed-rooms are propagating beds for consumption, and prove perfectly successful. So successful, indeed, are they that about one-fifth of all the people who die in some portions of the country—New England, for instance—die of consumption. There are thousands of these small bed-rooms in New England, hence the large harvest of death from consumption. No room less than 12 ft. or 14 ft. square, and from 7 ft. to 10 ft. in hight, is fit for a sleeping room, and even then there should be ample ventilation.

A New Planing Device.—A very simple method of planing at any required angle the edges of boiler and other plates, where this is needed to facilitate calking, is thus described by the *Engineer's* Mancheeter correspondent: "Instead of packing the plates at the required angle on the machine, as usual, the tool itself is made to work at any desired angle. This is accomplished by a swivel head, working upon two trunnions and moved backward and forward by a worm and worm-wheel, and which is locked fast in any position by means of bolts in radius slots on a radial plate attached to the slide. The machine itself consists of a long bed with a raised part for carrying the plates, and above this a girder with clamp screws for holding the plates in position. The tool is arranged to cut both ways, and is moved by a screw with reversing action."

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Prejudice Against Mining Machinery, Water for Blasting; Mica Masks for Furnace Men and Others; A New Safety Clutch, 425
Passing Events; Annual Expenditures on Claims; The Gold Run Case, 432. Assay of Manganese; Irrigating Wheel; New Mining Laws, Cooke's, Mitchell's Assaying, 433. Notices of Recent Patents, 436.
ILLUSTRATIONS.—The Palmer Safety Clutch for Elevators, 425. Apparatus for Assay of Manganese; Undershot Irrigating Wheel, 433.
CORRESPONDENCE.—Winters at Galena and Sawtooth, Idaho; The St. John Del Rey Mine, 426.
MECHANICAL PROGRESS.—Another Curious Experiment; Boiler Capacity vs. Heating Surface; School to Train Mechanics; A New Gas Engine, 427.
SCIENTIFIC PROGRESS.—Proposed Storage of Electricity; Large Photograph; Spontaneous Oxidation of Mercury and other Metals, 427.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meeting and Dividends, 428.
THE ENGINEER.—A Canal Boat Propelled by Air; Society of Mechanical Engineers; Experimental Ship-building, 431.
USEFUL INFORMATION.—The Difference Between a Cyclone and a Tornado; Effect of Sunshine; A New Patent Boot Heel Protector; Fires from Steam-heating Pipes, 431.
GOOD HEALTH.—Talk at Dinner; Malaria; Bread from Bark; The Sanitary Science of the Pentateuch; Unwholesome Sleeping Rooms, 431.
MISCELLANEOUS.—Mining Debris Question in Congress; Singular Change in a Mine; Christmas Chimes, 426. The Yield of Wood River Mines Last Season; Iron Ore in Shasta and Other Counties; The Hydraulic Pumps on the Comstock; Mining Frauds; The Mode of Working the Morey Ores, 430.

Passing Events.

The debris case at Sacramento is still continued. In another column we refer to it more fully. A great deal of the testimony taken is of course a repetition, nearly, of that previously elicited, and it is only occasionally that any important or interesting facts come to light.

The event of the week has been the hearing of the news of the *Jeannette* Arctic expedition. The reports are so far somewhat contradictory, but it is certain that Lieut. De Long has accomplished nothing. It is good to know that no lives have been lost, and that all hands will, within a few months, be back home again, safe and sound, but not very much wiser.

Another week and 1881 will be added to the long roll of finished years. Now that Christmas days are with us, we feel that with a prosperous future before the country, the holiday greetings will be more fervent and full of meaning than usual. "Happy New Year" will be, before long, the wish of many, and it is likely to the many it will be fulfilled. Our coast is now awakening to renewed activity and industrial progress, and we feel certain that the coming year will be one of undisturbed prosperity.

As to the PRESS, it intends keeping pace with the times and increasing its usefulness as it does in age. Reflecting as it does the state of industry in the community where it exists, its prosperity is assured. With this future in store, we can with heartiness renew our efforts to advance and improve, and we trust that our readers will find our determinations will meet with approval, and that they will second our efforts by assisting us with contributions both literary and pecuniary.

THE bill introduced by Representative Pettibone, relative to the retirement of army officers, provides that all general officers and officers of the different staff corps shall be retired from active service when they have served 45 years in the army, and all officers of the line shall be retired when they have reached the age of 60.

Annual Expenditures on Claims.

As the first of January approaches, miners are always in a state of excitement about the annual expenditures on their claims, and they are always more or less confused as to the law on the subject, though it is quite plain now. In order that they may be fully informed on the subject, we have gathered from various sources mining laws, decisions of the courts and of the Secretary of the Interior, rulings of the commissioner, regulations of the Land Office, etc., everything that we could on the subject of annual expenditure, and herewith present it for preservation and reference:

In the first place the section of the law referring to this subject is as follows: "On each claim located after the 10th day of May, 1872, and until a patent has been issued therefor, not less than $100 worth of labor shall be performed in improvements, made each year. *Provided*, that the period within which the work required to be done annually on all patented claims so located, shall commence on the first day of January, succeeding the date of location of such claim; or all claims located prior to the 10th day of May, 1872, $10 worth of labor should be performed in improvements made by the 1st day of January, 1875, and each year thereafter, for each 100 ft. along the vein, until a patent has been issued therefor; but where such claims are held in common, the expenditure may be made upon any one claim; and when a person or company has or may run a tunnel for the purpose of developing a lode or lodes, used by said person or company, the money so expended in said tunnel shall be taken and considered as expended on the lode or lodes, whether located prior to or since May 10, 1872, and such person or company shall not be required to perform work on the surface, to hold the lode as required by the act.

"Upon the failure to comply with the foregoing conditions of annual expenditure, the claim or mine upon which said failure occurred, shall be open to relocation in the same manner as if no location of the same had ever been made; *provided*, That the original locators, their heirs, assigns or legal representatives have not resumed work upon the claim after failure and before such location. Upon the failure of any one of the several co-owners to contribute his proportion of the expenditure required, the co-owners who have performed the labor or made the improvements, may, at the expiration of the year, give such delinquent co-owner personal interest in writing, or notice by publication in the newspaper published nearest the claim for at least once a week for 90 days, and if at the expiration of 90 days after such notice in writing or by publication, such delinquent should fail or refuse to contribute his proportion of the expenditure required, his interest in the claim shall become the property of his co-owners, who have made the required expenditures."

It takes 90 days after notice in writing, or 180 days after notice by publication before the delinquent partner can be dropped.

After you have made application for a patent, no further annual expenditures are required.

On claims located before May 10th, 1872, the law requires $10 a year on each 100 ft.; but where a number of such claims are on the same vein or lode, the aggregate expenditure necessary to hold all the claims, at the rate of $10 per 100 ft., may be made on any one claim.

By an amendment to the mining law, passed Jan. 22, 1880, it is provided "That the period under which the work required to be done annually on all unpatented mineral claims shall commence on the 1st day of January *succeeding* the date of location of such claim, and this section shall apply to all claims located since May 10, 1872."

It is held by the Land Office, that under this section, labor performed or money expended on a mining claim prior to the 1st day of January succeeding the date of location thereof, will *not* be considered as a part of or applied to upon the first annual expenditures required by law. Thus, upon a claim located at any time during the year 1880, the *period* within which the labor must be performed commences January 1st, 1881, and *during* the calendar year 1881 the annual expenditure must be made, or the claim will be subject to re-location, on and after January 1, 1882.

This point is an important one for miners to remember, inasmuch as it has been decided that where a claim was located October 1st, 1879, and the $100 worth of expenditure and labor was made after the location but *before* January 1st, 1880, that expenditure is *not* a compliance with the law; it must be during the calendar year 1880, *except* so much as is required by the local law. If the local law says 10 days' work must be done within 20 days from location, do the 10 days' work of course; but that work if done before the 1st of January succeeding the location will not count as expenditure required by Government laws.

In order to apply the law to a claim located prior to 1880, it will be necessary to calculate from the date of location. For instance, upon a claim located in 1875, the first expenditures would be reckoned as due within one year from Jan. 1, 1876, to wit: Jan. 1, 1877, and annually thereafter by the calendar year.

Of course it will be understood that this work may be done at *any* time during the calendar year.

Now, after you have done your labor, go and have it recorded. This can be done with the District Recorder, who may visit the claim and see for himself, but if he does not, a sworn statement will answer. If there is no District Recorder, leave your proof with the proper Recorder of Deeds for the county where the claim is situated; or the nearest Recorder to the claim wherever he may be.

The following form, taken from Copps' American Mining Code, is the proper one to fill out and record:

Proof of Labor.

State of———, County of———

Before me, the subscriber, personally appeared———, who, being duly sworn, says that at least——— dollars worth of labor or improvements was performed or made upon [here describe the claim], situated in——— mining district, ———county, ———State (or Territory) of———, during the year ending———, 188-. Such expenditure was made by or at the expense of———, owners of the claim, for the purpose of holding said claim.

———Signature.

[Jurat]

The record of an affidavit like the above is *prima facie* evidence of the performance of such labor.

Work done outside of a mining claim, with intent to work the claim, to be considered by intendment as work done on the claim, must have direct relation, and be in reasonable proximity to it.

Roads and necessary work may be included in the estimate.

Work done outside a claim for the purpose of prospecting or developing it, is as available for holding the claim as if done within the boundaries of the claim itself.

Where one person or company owns several contiguous claims capable of being advantageously worked together, one regular system may be adopted to work such claims; and work done according to such system for the purpose of prospecting or working all such contiguous claims, although done only on one of such claims, or even outside of all of them, is available to hold all such contiguous claims intended to be worked or prospected by such general system.

The fact that a large expenditure has been made upon a claim in the past will not release a claimant from the necessity of performing the required annual labor.

Failure to perform the labor or make the improvements required by Section 2,324 of the Revised Statutes, between the dates of entry and delivery of patent does not work a forfeiture of the rights acquired by entry, nor demand cancellation of the same, when such failure is brought to the attention of the General Land Office, by such relocation or otherwise.

The annual expenditures are necessary to support the possessory title only.

The act of Congress of Jan. 22, 1880, does not annul a provision of a State law which requires a discovery shaft to be sunk within a certain number of days from date of discovery.

A party who contributes his proportion of the *required* expenditures, can retain his interest in the mine. If the party fails to contribute his proportion of the *actual* expenditures upon a mining claim, the remedy must be sought elsewhere than in the General Land Office.

The Surveyor-General is not required to make a separate certificate as to the $500 improvements on a claim. Such a certificate is endorsed on both the flat and the field notes of survey of the mining premises in question.

The Surveyor-General, if not satisfied from the evidence on file that the required amount has been expended upon the applied-for lode by the applicant or his grantors, will require further evidence on this point before furnishing his certificate.

Hearings may be had to determine whether the legal expenditure has been made in a mine for which patent is desired.

An expenditure of more than $1,500 by the owners of an adjoining mine on the portion of a tunnel running through the premises embraced in an application for patent, in case the applicants were to have an interest in said tunnel, is considered an expenditure under the mining law upon the claim applied for.

In estimating the $500 expenditures essential to authorize entry, improvements made by former locators who had abandoned their claim, cannot be included.

Where a party applies for a patent for a relocated mine, it will be necessary for him to offer satisfactory proof that a sum of not less than $500 has been expended upon the same by the applicant or his grantors.

Annual expenditures are *not* required on placer claims, they being subject only to the operation of local laws, rules, regulations and customs.

The rules and customs of miners in a particular district are laws, and constitute the American common law of mining for precious metals.

Any citizen who is entitled to locate a lode on the public domain, may perform all the necessary acts of appropriation through the agency of others.

No specified amount is required to be expended to retain the ownership of a tunnel location; but locators are required to use reasonable diligence, and a failure to prosecute work for six months will be considered an abandonment.

The expenditures required upon mining claims may be made from the surface or in running a tunnel, for the development of such claims; the act of Feb. 11, 1875, providing that when a person or company has or may run a tunnel for the purpose of developing a lode or lodes, owned by said person or company, the money so expended in said tunnel, shall be considered as expended on the lode.

The Gold Run Case.

The taking of testimony in the now noted Gold Run case continues at Sacramento. The bulk of the testimony has proved what everybody in the State knows and admits, that the old river channels have for years been gradually filling up, and that there are large deposits of sand and sediment in and along the rivers of the valley which must necessarily have been carried there by the flow of the water from the hills and mountains. What proportion of these deposits came from the hydraulic mines is a subject of as much uncertainty as ever, and that any perceptible quantity of the said sand and sediment was washed from the mines of defendant, during the present ownership, is certainly not proven by the prosecution.

Some very interesting testimony has been elicited in the examination of Mr. Hamilton Smith, Jr. Among other things he cites the sizes of the reservoirs of leading companies:

The reservoirs of the Bloomfield company have a capacity of 1,050,000,000 cubic ft.; the Milton company's reservoir has a capacity of 650,000,000 cubic ft.; the Eureka Lake company, 1,130,000,000 cubic ft.; the Fordyce and the many other reservoirs of the South Yuba company contain about 1,800,000,000 cubic ft.; the Omega and the Blue Point United, 300,000,000 cubic ft.; the Spring Valley, 300,000,000 cubic ft.; the California Water Company have nearly 600,000,000 cubic ft.; the El Dorado company's reservoirs have a capacity of 1,070,000,000 cubic ft. There are also a number of small reservoirs on the Feather, Yuba, Bear and American rivers, whose collected capacity I estimate at 700,000,000 cubic ft., making a total of 7,600,000,000 cubic ft. of storage capacity of water. I am personally familiar with all these reservoirs except those belonging to the California water company and the El Dorado company. The water from these reservoirs is generally drawn from the middle of July on, for the next four months, during the dry season.

If this water was drawn regularly for the period of four months it would make a flow of 720 cubic ft. per second, which in a river 500 ft. wide, with a current of 1½ ft. per second, would increase its depth .95 of a ft. I know from my own knowledge of these reservoirs that the water is exhausted from them during this period of four months, and it is generally quite regularly drawn. The mines depend upon this supply of storage of water for the water which they use from the middle of July generally until the middle of November.

These reservoirs have a perceptible effect in restraining floods.

As an illustration, I may say that the mining reservoirs on the Yuba river will hold an aggregate amount of water equal to the discharge of the Yuba river at extreme flood for 24 hours. It would require the Yuba river to pour out its full flood for 24 hours to fill these reservoirs, and I have never seen that river remain at full flood for 24 hours. It has been very frequently proposed by engineers to restrain floods by the erection of reservoirs, and has been done in some cases I believe.

Mr. Smith thinks that the statement that the American and Sacramento rivers were clearer from sediment this year than for some time, was not due to the stoppage of hydraulic mining. On the American river there is one mine stopped by injunction; that was the Gold Run mine. The injunction was served after the usual supply of water was exhausted. It would have worked no more in any event. There were five mines stopped by injunction in Nevada county—the Excelsior, North Bloomfield, Milton, American and Blue Tent companies. They were stopped early in June. All those five mines in Nevada county are working this deep and heavy blue gravel, in which the duty of a miner's inch varies from two and a half to four yards. By these injunctions the water which would have been used in these mines on that deep and heavy gravel was sold to other companies, who used it in washing top or surface ground, so that the ultimate result of the stoppage by injunction was to discharge into the rivers the surface gravel instead of bottom and heavy gravel. Therefore, so far as these injunctions or suits are concerned, there was more debris discharged into the Yuba river than would otherwise have been the case. The only possible explanation I can give, as far as mining is concerned, is that generally throughout the mining district they are working more bottom than surface gravel. The general tendency now is to work bottom gravel instead of top gravel.

A MINING SUIT.—Carmel W. Beach has brought suit against J. B. Cooper, A. B. Cooper, Geo. A. Ball, John McNiel, Manuel San Pedro and the Alexander Mining Co. for an accounting of the individual defendants to the Alexander Co., and to restore to the stockholders thereof all moneys and property belonging to the company, and to enjoin the officers of the company from proceeding to enforce an assessment levied upon the capital stock of the company on the 31st of October last, so far as it affects the stock claimed by the plaintiff. The complaint alleges fraud and conspiracy upon the part of the defendants in the management of the Alexander Mining Co., in the Grantsville mining district, Nye county, Nev.

Assay of Manganese.

The following method of assaying manganese is taken from C. H. Aeron'e "Leaching Gold and Silver Ores":

Take a short necked flat bottomed flask of three nnnces capacity, snch as shown in the engraving, and fit into it a cork through which pass two glass tnbes of abont one-eighth inch bore. One of the tnbes mnst extend nearly to the bottom of the flask; the other, about three inches in length, is bent to a right angle abont an inch from one end, the shorter limh being passed thronqh the cork. Now take the barrel of a small glass syringe, such as is used for medical purposes, the orifice of which must be enlarged by cutting off a portion of the beak. Fit a cork to the larger end, and through it pase the disengaged end of the bent tube, the other end of which is in communication with the flask. Place in the syringe eome pieces of pumice stone, and moisten them with sulphuric acid; attach to the bent tuhe hy means of the cork. A test tube suspended from the neck of the flask completee the apparatus, which is represented by the accompanying cut.

Weigh 99 grains of the finely pulverized manganese which place in the flask. Add one ounce of cold water, and then 150 to 160 graine of sulphuric acid. Replace the cork in the neck, with the glass tubes, and applying the lips to the orifice nf the syringe, suck air through the flnsk. This ie done for the purpose of removing any gas which tbe acid may cnuse to be evolved from impuritiee in tbe manganese. Now weigh 150 graius of oxalio acid which plaoe in the test tube, put the entire arrangement upon the pan of a balance which will indicate one-tenth grain, and counterpoise it.

Remove the apparatns from the balance, throw the oxalic acid from the test tnbe into the flask, cork instantly and set aside for a short time. When effervescence ceases, warm slightly, which will renew it, and when no more gas is evolved draw sir throngh the flask as hefore. Place the entire apparatus again on the scales. It will be found to be lighter than before, and the nnmber of grains required to restore the equilibrium will be the percentage of biuoxide in the sample.

This method, while not rigidly accnrate, is sufficiently so for practical purposes. It depends on the circumstance that oxalic acid, in presence of sulphuric acid and manganese binoxide, is converted into water and carbonic acid gas, (cnrbon dioxide). The water remains in the apparatns. The gas escapes through the tube containing pumice imbued with sulphuric acid, which retaine any vapor of water which might otherwise pass off, the last portion of the gas being drawn ont by the mouth as directed. Thus nothing hut the carbonic gas escapes, and as 99 graine of pure binoxide produce almost exactly 100 grains of the gas, it followe that the weigbt lost corresponds to the percentage of binoxide in the sample.

Having assayed the salt and manganese, the relative proportion in which they should be used remains to be considered. It has already been intimated that practice does not conform strictly to theory, not because the theory is incorrect, but hecause the oonditione attainable in working do not admit of its complete realization. Hence it is found necessary to use sulpburic acid in excess of tbe chemical equivalent of the manganese, and ae sulphuric acid is only nseful in conjunction with a snfficient quantity of salt, the latter must also be in excess of tbe manganese.

For thie reason, instead of only 27 ponnds of pure salt to 20 pounds of manganese hinoxide, we use 36 pounds; these qnantitiee usually suffice for the chlorination of three tons of roasted ore. In order to ascertain bow many ponnds of the impnre materials mnst he used, it is only necessary to divide the quantity of the pure snhstance required by the fraction representing tbe percentage found in tbe assay.

Example: Suppose the assay of the salt gave 87 per cent, it is required to know how mnch of it is equal to 36 pounds of pnre salt, then $36 \div .87 = 41.37$ pounds; again, if the manganese is 66½ per cent, then $20 \div .665 = 30$ pouuds of tbe manganese to 41 pounde of the salt, wbich is about the proportion generally nsed, bnt either or both of the eubstances may vary from this supposition.

Ae to tbe acid, the qnantity requited depende so much on the temperature of tbe generator, and the nature and qnantity of the impurities in the other materials, that no other rule can be given than this; it must be added in emall portions as long as it continues to develop a nseful qnantity of chlorine. It will soon be diecovered how mucb ie required for a given quantity of salt and manganese.

The strength of the acid is indicated by ite density, as measured by a Beaume hydrometer, wbicb is eimply a floating gauge—the bigber it floate the stronger is the acid, and the reverse.

Mining Superintendent Resigned.—Geo. S. Powers, who recently reeigned hie poeition ae euperintendent of the Blue Tent hydraulic mine, proposee to pay a visit to tbe Eastern Statee before long. Mr. Powers, during bis mauagement of that property, has shown himeelf to he energetio and indefatigable in the discharge of hie duties; bnt the presence of an injunction and the lack of water render his fnrther services unnecesoary. Like ex-Superintendente McMurray, O'Brien and Perkine, he finde his occupation gone.—*Nevada Transcript.*

Irrigating Water Wheels.

[Written for the Press by Albert Williams, Jr.]

A very simple expedient for raising and distributing water from main irrigating ditches ie illnstrated by the accompanying engravings. In many cases where the ground is nearly level a lift of from 4 to 10 ft. is sufficient; nnd this may be cheaply and effectively attained by the nse nf an undershot wheel, carrying self-emptying water boxes, like the one sbown, or constructed ou the same principle with modifications. This system is one of the many ingenious contrivances in which modern mechanical progress has been forestalled by the Asiatic races, by whom it hnd been employed for centuries previoue to being borrowed, or, more probably, re-invented, in thie country. It is now adopted qnite extensively in many placee where the conditions are favorable, and gives very eatisfactory results.

There are mnny cases where the irrigating water wheel comes into play successfully. To define them, the requirements may be stated as:

First—That the water should be bronght by ditchee from eome constant source, as a river, reservoir, lake or other body of water.

Second—That it shonld hnve, at tbe point of delivery, a considerable velocity, eay two miles an hour, or more. With higher velocitiee the results, up to a reasonable limit, are better.

Third—That there shonid be efficient volume of water to allow epace for the buckets to work in.

Fourth—A surplus of water over the amount required to be delivered at any given point.

Fifth—That it ehould be necessary to lift the water only to a moderate hight—the system working better with a six-ft. lift, for instence, than if it be required to raise the water 12 ft.

Given all tbe above conditions, tbe undershot water wheel may be safely relied on, and wherever it can be nsed at all, it can he used advantageously and economically. It is far from being a perfect mechanical contrivance, and is admittedly wasteful of power; hut if the water raised is sufficient for its purpose, the balance not utilized except as a mean of driving the wheel may he disregarded, or may be brougbt into service in irrigating lower portione of the land or in working similar wbeels at various pointe down stream.

In the cuts, Fig. 1 ie a eide elevation showing the general method of construction. Eight paire of arms, carrying plain flat buckets like those of a steamboat paddle-wheel extend from a hub rotating on metal bearings. At either end or both ends of each bucket are fixed water-boxes wbich fill themselvee on entering the water, and on being brougbt to the highest point of rotation empty themselves into a receiving trough. This trough supplies the distributing ditches, etc., and its inner end is so placed that it comes nnder the projecting buckets of tbe wheel witbout interference with the motion of the arms. The current of water in the channel underneath forces the buckete down stream, the latter delivering in the opposite direction at the top. By using a double eet of buckets, one at each end of each bucket, the water may be delivered on both eides simultaneously. A little experimenting will indicate tbe proper size of the boxes, whicb depende upon the velocity and volume of water in the channel as well ae the amonnt to be delivered.

Such a wheel can be readily constructed by any mechanic, and will cost from $25 to $50, according to size and workmanship. It may be made altogether of wood, with the exception of the bearings, but for the larger sizes (of from 8 ft. to 15 ft. or npward) it is advisable to brace well with wrought-iron tie rods. The water boxes may be made of wood, bnt perhaps the most convenient arrangement is a set of tin cracker-boxes, or some similar metallic receptacles—the eize choson to be in direct ratio witb the force of the current. It is not nsual to paint the wheele unless iron enters largely into the constrnction, in which case red lead may be nsed.

A large number of wheels similar in general construction to the one shown, are in use in the Boise river valley, Idaho. At Boise City where the gardens are remarkable for their beauty and constant verdnre, irrigation is conducted by a eeries of these wheels, which, from their simplicity and effectiveness fully meet all requirements. In some places this wheel may be used of course, to bring water to mines.

New Mining Laws.

Beside the debris bill introduced in Congress, and which we refer to elsewhere, other bills interesting to the mining commnnity have been submitted. Congressman Davis, of Illinois, has introdnced in the House of Representatives a bill to amend the mining law, to provide "that in any case where, between two locatione on the same lode or vein, or between a location and any natural object which forms a visible or apparent termination of such vein, there shall he a remnant or portion of said lode or vein not exceeding 1,500 ft. in length, not located or otherwise appropriated for the space of one year, and the same shall not be open and visible or readily accessible to any part thereof by reason of being deeply covered or otherwise inacoessible, it shall he lawful for the owner or claimant of either of the adjoining ends of said lode or vein to make the claimant or owner of either of the adjoining ends of said lode or vein to make a claim to such unlocated remnant, and to locate it as an extension of the lode held hy him, and to obtain a patent for it witbout performing the labor required in case of the discovery and location of an original claim." The bill further provides, that in case application bas not been made for a patent on euch original claim, the application for it mny include tbe extension as aforesaid in all such unappropriated tract that the locator set up notice, and file certificate of location, indicating hie claim to such tract as an extension of the adjacent lode; provided, however, that snch owner shall apply for a patent on each remnant within two years after sucb location, or it shall be held as abandoned and open for location as in other cases.

Mr. Davis has also introduced a hill to amend the act of June 3, 1878, authorizing the citizens of Nevada, Colorado and the Territories to take timber from the public domain for mining and domestic purposes, by adding to its firet section a provieo as follows: "Provided that nothing in thie act shall he conetrned to authorize any perseon other than the holder of a claim or location upon a mineral lode, or other mineral land, made and held pursuant to lawe relating to mineral lands, to enter upon encb claim or location, and cut, remove or destroy, or otherwise injure, the timber upon euch claim or mineral location."

The Idaho mine, Grase Valley, yielded $48,000 in November.

Cookes'-Mitchell's Assaying—No. 2.

[Written for the Press by C. H. Aaron.]

An omission from the old work, which sbould be, and is not, supplied in the new, occura in the direotions for assaying ores for gold and silver. It ie this: No mention is made of the fact that certain highly oxidized ores require the addition of an extra quantity of carbon, flour, or other reducing agent, in order to produce the requisite quantity of lead for cupellation. If a preliminary nssay of such ores be made according to the direotions given, no lead will be obtained. From the further directions, the etudent will infer that the addition of six grains of carbon in the assay proper will reduce from the litharge about 180 grains of lead, but in tho case of an ore containing much iron peroxide, for example, he will find little or no lead. This is perplexing to students.

Roasted pyrites require just double the usual quantity of carbon ns compared with an ordinary ore which gives no lead in the preliminary assay. Some ores containing chromium also reqnire an extra dose. In euch cases a preliminary assay of the ore may be made with a large nnd known quantity of the reducing ngent, and the assay proper dressed according to the result. The applicability of the assay made with nails to sulphuretted ores of gold and silver, a method much used in this country, and which properly conducted gives results as high as any in most cases, and possesses several advantages, should be mentioned, as well as the conversion of an oxidized into a sulphnretted ore, or of a metal into a sulphuret by an addition of sulphur to the assay, as described in my hand-book on "Leaching Gold and Silver Ores," it being very convenient in certain cases. Sulphnr is alsn useful in certain assays of tin, nnd arsenic in assays nf nickel, cobalt, etc., especially for the purposes of prospecting, and under circumetances which forbid tbe use of the complicated wet methods.

That which I call the nail assay is similar to the method described by Mitchell as applicable to the assay of galena for lead, except tbat, when the ore contains little or no lead, a sufficient quantity of litharge is added to produce the requisite lead button. The method is best adapted to sulphuretted ores, and is especially convenient from the fact that, as all the litharge used is reduced to lead, the weight of the button is under perfect control without the necessity of a preliminary assay. Many mill men employ it for all ores, using about half an ounce of litharge, some charcoal or flour, two or three tenpenoy nails, and as much soda and borax as will suffice to effect thorough fusion, to half an onnce of ore, frequently adding a fragment of glass. Of course, if the ore contains a considerable quantity of sulphur, there is no necessity for using charcoal or flour, and if it contains mucb quartz, tbe glass is also superfluous; but one of the merits, perhaps the chief merit of the process is, that even if these things are not necessary, yet they do no harm, so that a general formula answers for almost any kind of ore, and a person who is not competent to select those modifications which are indispensable in other methods, may nevertheless make an assay in this way with confidence in the result.

If, however, this process is used indiscriminately for all classes of ore, a case may be met with in whicb a slight modification is desirable. It is that of oxidized ores containing mnch copper. These ores generally indicate the presence of copper hy a blue or green color (carbonates, arsenistes, etc.), but the oxide of copper is black, the suboxide red. Such ores, when assayed with or without tbe use of nails, generally yield a button of lead containing a considerable quantity of copper, whicb causes a loss of precious metals in the cupellation.* Now, if to such ores we add a sufficient quantity of sulphur to convert the copper and litharge into sulphides, and uails to metallize the sulphide of lead so produced, the copper remains in the form of a matte, and a good lead button is got for cupellation. It is not necessary to adjust the quantity of sulphur exactly, as the nails will take up any excess, so that a general formula might embrace the addition of sulphur to all ores; but as anybody who knows even a little about ores can easily distinguish those that contain much sulpbur from those which do not, this is not necessary.

The chief point to he observed in thie assay is, that it be kept in the fire until the nails, when taken out, shall have no lead adhering to them so that it cannot be rinsed off in the liquid slag. I am well aware that some professional assayers consider this method to he imperfect, but I can assure your readers that it will give, in nearly every csse, as high results as can be got by any other fire assay, while possessing the advantages indicated. In only one case bas this method failed in my hands, and in that case all crucible methods failed, a correct result being gotonly by scorification. The substance operated on was a highly arsenical matte from a emelting furnace.

*The use of an abundance of litharge will prevent the copper from coming down, but is very destructive to the crucible.

The mining lawe of the United Statee recognize and eanction the cuetom nmong minere of organized districts to adopt local laws or rnlee, governing the locator, recording and working of claims, not in conflict with State or Federal legielation.

PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

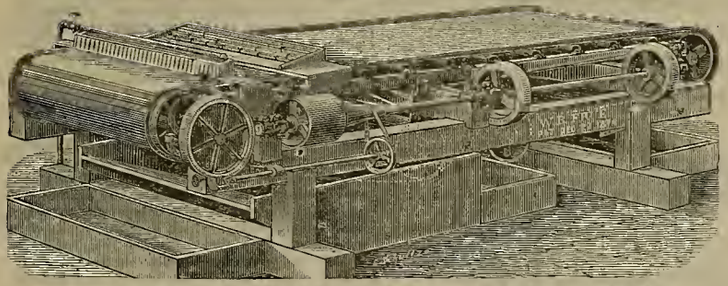
Telegraph, Bailing and Fencing, etc.

WIRE STAPLES AND WIRE NAILS.

Wholesale and for Export.

$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

COMPOUND OXYGEN NOT A DRUG

A NEW TREATMENT for Consumption, Asthma, Bronchitis, Catarrh, Dyspepsia, Headache, Debility, Neuralgia, Rheumatism, *and all Chronic and Nervous Disorders.*

ACTS DIRECTLY upon the great nervous and organic centres, and *cures by a natural process of revitalization.*

HAS EFFECTED REMARKABLE CURES, which are attracting wide attention.

HAS BEEN USED BY Rt. Rev. John J. Keane, Bishop of Richmond, Va., Hon. Wm. D. Kelley, T. S. Arthur, and others, who have been largely benefited, and to whom we refer *by permission.*

IS STRONGLY ENDORSED: "We have the most unequivocal testimony to its curative power from many persons of high character and intelligence."—*Lutheran Observer.* "The cures which have been obtained by this new treatment seem more like miracles than cases of natural healing."—*Arthur's Home Magazine.* "There is no doubt as to the genuineness and positive results of this treatment."—*Boston Journal of Commerce.*

THE OXYGEN HOME TREATMENT contains two months' supply, with inhaling apparatus and full directions for use.

SENT FREE: a Treatise on Compound Oxygen, giving the history of this new discovery and a large record of most remarkable cures. Write for it. Address

Drs. STARKEY & PALEN,

ADMINISTERED BY INHALATION. 1109 and 1111 Girard St., Philadelphia, Pa.

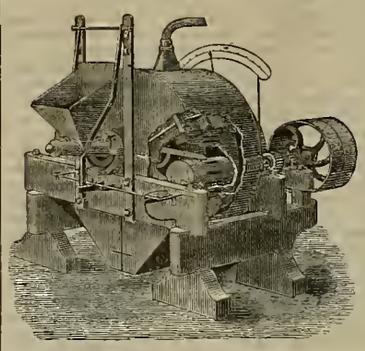
Depository on Pacific Coast.

WE HAVE ESTABLISHED A DEPOSITORY OF OUR COMPOUND OXYGEN HOME TREATMENT at San Francisco, Cal. This will enable patients on the Pacific Coast to obtain it without the heavy express charges which accrue on packages sent from Eastern States. All orders directed to H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., will be filled on the same terms on which we fill orders sent directly to our office in Philadelphia.

Patients ordering from our depository in San Francisco, should, at the same time, write to us, and give a statement of their case, in order that we may send such advice and direction in the use of the Treatment as their special disease may seem to require.

DRS. STARKEY & PALEN, Nos. 1109 and 1111 Girard Street, Philadelphia, Pa.

TUSTIN'S ROTARY PULVERIZING MILL.



WORKS ORE WET OR DRY,

And Feeds Itself Automatically.

Patented October 17, 1881.

One of these machines can be seen at the Ore Sampling and Pulverizing works of Hofmann Bros., No 415 Mission St., where it is working every day. Weight 5,000 lbs., heaviest piece 480 lbs.

Manufactured at the

TUSTIN WINDMILL, HORSE POWER AND PUMPING MACHINE WORKS.

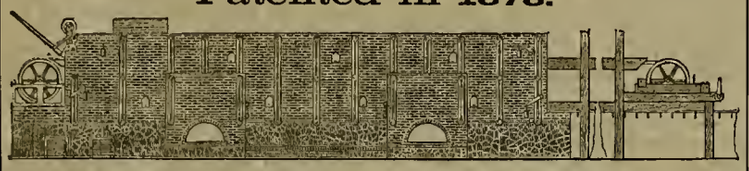
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

THE O'HARRA
CHLORIDIZING FURNACE.
Patented in 1878.


SIDE ELEVATION OF THE O'HARRA FURNACE.
This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.
BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.
An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.
A cheap Furnace to build and to run.
The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulpburize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.
At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.
At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.
Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.
SEND FOR DESCRIPTIVE CIRCULAR TO
WHITNEY, VEASEY & CO.,

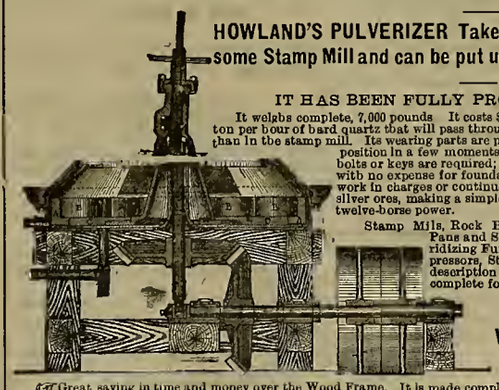
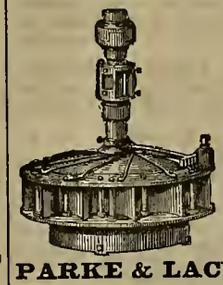
Agents for San Francisco, KUSTEL & CO., 318 Pine Street.

MOREY & SPERRY.
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery


HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.


PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

NOTE.—Copies of U. S. and Foreign Patents furnisbed by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All pateut business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

FEEDER FOR THRASHING MACHINES.—John P. Cobb, College City, Colusa Co., Cal. No. 250,786. Dated Dec. 13, 1881. The object of this feeder for thrashing machines is to regulate or distribute the unthrashed straw and grain as it passes upon tbe elevator from the derrick wagon to the feeding device which introduces it to the thrashing cylinder. It consists of new and useful devices attached to and situated over the elevator, such device having independent reciprocating oscillating pickers or tines operating over an elevator, said tines being adapted to have a vertical adjustment as a whole, and to have a separate individual adjustment to regulate their stroke. Where long straw is passed through the thrashing machine it does not require as much check as when short straw is being worked, because the proportion of grain on the former being less the eame amount will not clog the riddles; but when short etraw is being passed through it requires to be checked more because it is more likely to interfere with the thrasher by choking the riddles. The vertical adjustment of the tines either separately or together provides for this; when long straw is being fed they may be raised; when short straw is being fed they may be lowered, so that they may tear the bunches more.

PORTABLE HOUSE.—Wm. H. Wrigley, Oakland. No. 250,867. Dated Dec. 13, 1881. This invention relates to a novel construction for that class of houses which are made in sections and fitted all ready to he set up at any time; and it consists in certain improvements in the formation and method of uniting the parts of the building whereby the inventor is enabled to make a neat, serviceable house, easily set up at any point, and having a complete exterior and interior finish. It can also be built with double walls, which will make it more solid. The interior walls are pierced or cut away below the plane of the floor to admit air from the epace beneath the house, while the space between the walls communicates at the upper end with the space between the raftere of the roof, so as to promote a draft through the space, and thie will keep the interior of the house cool.

TRACE HANGER.—W. H. Reyburn, Cuffey's Cove, Cal. No. 250,841. Dated Dec. 13, 1881. This invention relates to certain improvements in harnesses, and more especially to a new and useful attachment, the object of which is to hang up the traces, and may therefore be called a trace hanger. When the horse is unhitched, and the trace is lowered from the whiffletree, its end ring is brought up to the hanger, which has clasps on it. The slightest pressure opens the device by pressing down on the lower clasp, and the ring steps in between them and is secured therein by the lower. The trace, if caught on anything while the horse is walking off, will not be injured, as it will easily pull out, requiring no more force to release it than to insert it. The only object is to hang it up, and this it does. It is in a most convenient position to receive the trace, and when using a young and restive animal is a decided advantage, because one does not have to go close to him to take out the trace. A slight pull on any portion will remove it,

Christmas and Christmas Observances.

We find tbe following interesting statements concerning Christmas in the latest edition of "Chamber's Encyclopædia:" Christmas, ths day on which the nativity of ths Savior is observed. The institution of this festival is attributed by the spurious Decretals to Telesphorus, who flourished in the reign of Antoninus Pins (138-61, A. D.), but the first certain traces of it are found about ths time of the Emperor Commodus (180-192, A. D.). In the reign of Diocletian (284-305, A. D.), while that ruler was keeping court at Nicomedia, he learned that a multitude of Christians were assembled in the city to celebrate tbe birthday of Jesus, and having ordered ths church doors to be closed, he set fire to the building, and all the worshipers perished in ths flames. It does not appear, however, that there was any uniformity in the period of observing the nativity among the early churches, some held the festival in the month of May or April, others in January. It is, nevertheless, almost certain that the 25th of Dec., *cannot* be the nativity of the Savior, for it is then the hight of the rainy season in Judea, and shepherds could hardly be watching their flocks by night in the plains.

Christmas not only became the parent of many later festivals, such as those of the Virgin, but especially from the 5th to ths 8th century, gathered round it, as it were, several other festivals, partly old and partly new, so that what may be termed a *Christmas cycle* sprang up, which surpassed all other groups of Christian holidays in the manifold richness of its festal nsages, and furthered, more than any other, ths completion of the orderly and systematic distribution of church festivals over ths whole year.

Not casually or arbitrarily was the festival of the Nativity celebrated on the 25th of Dec. Among the causes that co-operated in fixing this period as ths proper one, perhaps the most powerful was, that almost all the heathen nations regarded the winter solstice as a most important point of the year, as the beginning of the renewed life and activity of ths powers of nature, and of ths gods, who were originally merely the symbolical personifications of these. In more northerly countries, this fact must have made itself peculiarly palpable; hence the Celts and Germans, from the oldest times, celebrated the season with the greatest festivities. At the winter solstice, the Germans held their great Yule feast, in commemoration of the return of the fiery sun-wheel; and believed that during the 12 nights reaching from the 25th of Dec. to the 6th of Jan., they could trace the personal movements and interferances on earth of their great deities, Oden, Berchta, etc. Many of the beliefs and usages of the old Germans, and also of the Romans, relating to thie matter, passed over from heathenism to Christianity and have partly survived to the present day. But the church also sought to combat and banish—and it was to a large extent successful—the deep-rooted heathen feeling, by adding—for the purification of the heathen customs and feasts which it retained—its grandly devised liturgy, besides dramatic representatione of the birth of Christ and the first events of his life. Hence sprang the so called "manger songs," and a multitude of Christmas carols, as well as Christmas dramas, which at certain times and places, degenerated into farcee or fools' feasts. Hence also originated, at a later period, the Christ-trees, or Christmas-meats and dishes, such as Christmas rolls, cakes, currant-loaves, dumplings, etc. Thue Christmas became a universal social festival for young and old, high and low, as no other Christian festival could have become.

Academy of Sciences.

Dr. Behr presided at the meeting of the California Academy of Sciences last Monday evening. Among the donations was a gigantic sixth tooth and several large fragments of the jaw and of the vertebral bones of the Mastodon Giganteus, recently found by Wm. T. Lambie, at a depth of 83 ft., while excavating a well at Bowie Station, Arizona. Commodore Thos. S. Phelps, U. S. N., presented a piece of tarred canvas, of which the following is the history: "During the early part of 1881, the U. S. steamer *Lackawanna*, while getting under weigh at the Island of Juan Fernandez, brought up on her bower a much-decomposed anchor of the pattern used during the 17th and 18th centuries, which, judging from ite appearance, had been on the ocean bottom from 150 to 200 years. The anchor is 12 ft. long. The shank has become reduced by decomposition to about one-third of its original thickness, the arme and palme are half gone, and the ring made to receive a hemp cable, which was originally three inches in diameter, has become reduced about two-thirds, and in one place, for about six inches, has rotted entirely away. The canvas parceling, which was wrapped around the ring to prevent injury to the cable, is comparatively well preserved, although the cable and wooden stock have long since disappeared. The endnrance and condition of the canvas, under the circumstances, possesses a signifioant interest.

Lieutenant Frederick Schwatka presented a list of relics found by tbs Franklin search party of 1878-79-80 under his commaud, and a photograph of the medal belonging to Lieutenant J. Irving, R. N., found with and brought home with his bones.

W. G. W. Harford presented a new crab; W. J. Fisher, an Aleut stone-lamp, a slate whale-spear and scraper, spoons and numerous fossils from Alaska. From J. C. S. Stubbs, a collection of invertebrate fossils found near Shakespeare, New Mexico.

Daniel M. White presented a gray and white spotted deer skin, from near Port Townsend, W. T. It was discovered that the deer on an island off the coast are all white like Albinos, and this one was the offspring of one of these white deer which had reached the coast and united with the well-known gray deer. Prof. Davidson who had lived in the vicinity hardly believed the story of the island with white deer, since all the islands were close together, and the deer move from one to another frequently. Moreover, this island would be visited by hunters who would soon depopulate it. Mr. D. J. Staples, had, while coming overland, seen five white deer in a band.

S. B. Christie presented a mammoth cave fungi found in Napa county. W. J. Fisher presented specimens of fine micaceous granite, and four pieces of rock containing sulphuret of iron from Kodiak island, Alaska; also, a fine specimen of native amber, from Sutkum, Alaska.

Mr. J. B. Clifford sent a specimen of insect pest, and said: Having discovered a pest which infests artificial flowers and feathers, in making of which paste has been employed, I ask you to determine its name and habits. The insects are very small, brown, and bore into the goods. They must be French insects or natives of Europe, as they have never attacked American made goods. They are rather expensive boarders, and besides cost 60% duty. Do you know of a remedy?

This matter was referred to Dr, Behr, who will examine the insect.

J. G. Lemmon read a paper on a new species of buttercup from Arizona, and also made some remarks about the naming of new species on this coast, to which we will refer in a future number.

Mr. Edgar Mills was proposed for life membership, and C. Mitchell Grant as a resident member.

The committee appointed to nominate the "regular ticket" to be voted for at the coming annual election, renominated all the old officers and truetees, saying: "After diligent inquiry, your committee find that all the gentlemen named have, in their several places, and likewise in ther personal devotion to the interests of the Academy, rendered it important services. Observing, therefore, the rule of fitness and just recognition of fidelity, your committee commend them for re-election."

News in Brief.

JOHN P. JONES has been chosen a Director of the United Globe Electric Light Co., New York.

DR. ISAAC I. HAYES, well known in connection with Arctic exploration, died Saturday in New York.

THE surveyors of the Carson and Colorado railroad have completed their final lines into Candelaria.

A TERRIBLE typhoon is reported from China, one town being entirely destroyed and 3,000 inhabitants killed.

ADMIRAL BIRD, the commander of the *Investigator*, in Sir John Ross' expedition in search of Franklin, is dead.

THE international railroad has been completed to Laredo, Texas, and the Rio Grande will soon be bridged.

DURING the week ending Dec. 17th, standard silver dollars to the number of 448,495 were coined at the United States mints.

THE English Embassador at Constantinople refusee to allow the Turkish authorities to search a British ship for explosives.

THE precautions against fire ordered by the Paris authorities in the Theater Francaise will involve the closing of that theater for a month.

DURING the five months ending November 30th there arrived in this country 291,318 immigrante, against 254,262 for the eame period in 1880.

IT is said Germany does not intend to await the return of Von Schleezer to Rome, but proposes to intrust negotiations at the Vatican to another diplomat.

THE town council of New Tacoma, W. T., has levied a tax of one cent on the dollar on all property within the corporation, to pay the indebtedness incurred by the visitation of the smallpox.

THERE were two important incidente last week connected with Ireland: The suppression of the Land Leaguer Egan, which English opinion approves, and the formation of the Lord Mayor's Committee.

THE Corralitos Water Co., which supplies Watsonville with water, threatene to reduce the pressure in the town maine unless the town will pay them $150 per month—a sum which the citizens consider exorbitant.

ENGLISH papers announce the birth of a son on the 17th ult. to Lady Hesketh, at Rufford Hall, Lancasbire, an heir to the baronetcy. San Francisco readers will recognize in Lady Hesketh the daugbter of ex-Senator Sharon,

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

Telephone No. 75.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long established, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

Corner Beale and Howard Sts.,
SAN FRANCISCO, CAL.
W. H. TAYLOR, Pres't. JOSEPH MOORE, Sup't
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

DODGE ROCK BREAKER
Challenges the World
To produce as good and cheap a Machine. Rock Breaker and Cornish Rolls combined in one Machine. Pulverizers, to Granulate Ores, for Roasting, Chloridizing, Leaching and Concentrating.

Concentrating Machinery!
FOR CONCENTRATING
Gold, Silver, Lead and Copper Ores.
Furnaces for Roasting and Chloridizing Ores, for Amalgamation or Leaching.
Plans, Drawings and Estimates for Working Ores by any process.
M. B. DODGE,
143 Fremont St., - - San Francisco

San Francisco Pioneer Screen Works
J. W. QUICK, MANUFACTURER,
SCREENS
Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.
32 Fremont Street, San Francisco.

Diamond Drill Co.
The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

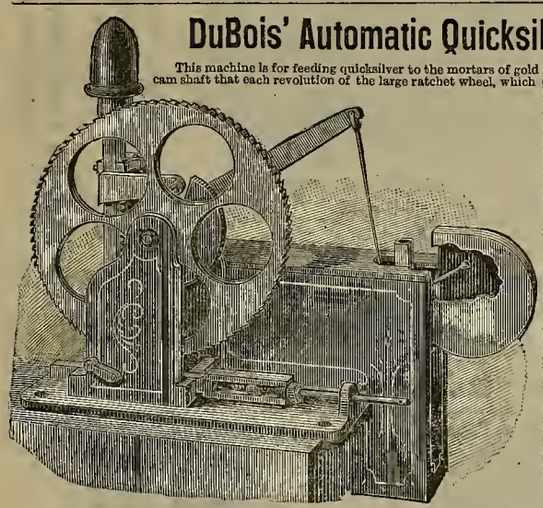
DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.

Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

TO HYDRAULIC MINERS, RAILROAD CONTRACTORS,

And others Engaged in **BANK BLASTING.**

HAVE YOU TRIED THE

GRANITE BLASTING POWDER?

If you have not, give it a trial and you will be satisfied that it will do more work for less money than any Powder in the market, and refer to numerous testimonials in support thereof to be found at our office.

Put up in kegs of 25 lbs., either glazed or not, to suit customers.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, DECEMBER 31, 1881.

VOLUME XLIII. Number 27.

The Spring Valley Hydraulic Gold Mine.

The Spring Valley mine at Cherokee, Butte county, heing the largeet hydraulio mine in the State, whioh ie now in active operation, merits notice at this time not only on acoount of the magnitude of its worke, but aleo on account of the great foreeight of ite former ownere in eolving the debrie question ae far ae it affecte thie property.

A sketch of the past history of the property, as well as ite preeent workings and fnture proepects, will probably be intereeting to many readere of the PRESS. For thie we are indebted to the courteey of Mr. G. F. Williams, whoee connection with the mine makee him familiar with all the details.

The mine ie located at the extreme northern end of Table mountain, which forms the firet highland north of the town of Oroville. The problem of bringing an adequate supply of water to the mine wae difficult to eolve, as it wee neceeeery to croee deep river canyons in order to get the water upon the mine with enfficient elevation for hydranlic purpoeee.

Thie work was eucceefully accompliehed in 1870, when a pipe 13,100 ft. in length and 30 inchee in diameter wae laid acroee the weet branch of Feather river throngh a depreeeion of 887 ft. below the diecharging end of the pipe. The receiving end of the pipe hae a perpendicular elevation of 1,067 ft. ahove the hridge upon which the pipe ie laid acroee the river.

The greateet pressure ou thie pipe at the bridge is 384 lbs. per equare inch, or about 18 tone to every running inch of pipe. The main supply of water need at the mine has been obtained from Butte creek eince 1873. It is carried acroee the west branch of Feather river throngh a pipe 3,780 ft. long and 30 inchee in diameter. The perpendicular hight of the diecharging end of the pipe ie 630 ft. above the river. The water ie conveyed thence to Concow reeervoir in a ditch. Thie reeervoir covers 210 acree of lend and has an average depth of 26 ft. The water ie conveyed from the reeervoir through a ditch to the head of the main pipe above mentioned, thenco to the mine.

The average deily amount of water which paeeee through this pipe ie 2,200 miner' inchee, or ahout 37,500,000 gallone. In addition to the above supply, the waterehed in the vicinity of the mine furnishee from 500 to 1,000 inches during the rainy eeaeon. The following figuree will ehow the expendituree of the company from 1870 to 1880:

For ditches, pipes, flumee and reeervoire, $375,820.

For mining ground whicb was originally located and held in emall claime, the sum of $411,113 bas been paid.

The expeneee for mining, including tunneling, eluicee, etc., have been $921,907.

For ranch property, purchaeed to prevent litigation on account of the debris from the mine, the compeny has paid $395,196, and for leveee and other improvemente on eame, $154,708.

In addition to the above amount, the enm of $465,000 hae been paid to the etockholdere in dividende.

The total yield of gold during that period of time (1870 to 1880) hae been $2,650,809. The above figuree are taken from the published report of the Secretary of the compeny, and ehow only the receipte and expendituree of the company before the property chauged hande.

Ahout 18 montha ago the property wae eold to Eastern capitaliete, a considerahle portion of the etock being etill held by residente of thie State.

Under the present adminietration the enm of $19,500 has been expended on ditchee and reservoirs, and $21,400 on levee embankments. The yield of the mine eince changing hande has not heen ae great ae dnring previoue yeare, owing, to a great extent, to the insufficiency of grade to work the best gronnd. The yield hae been about $320,000, which amonnt, witb the exception of $50,000 paid in dividende, hae heen paid out for lahor and improvement, which include the running of a new bedrock tunnel.

The area of mining ground which can be worked by hydranlic procese ie between 200 and 300 acree. During former years only a very small portion of the ground was worked to the bedrock. The geological formation of the deposit ie as follows, commencing at the top:

1. Basalt caprock, covering only a small portion of the hydraulic ground owned hy the company.

2. Pipe c'ay, varying in thickneee from 20 to 200 ft.

3. Fine gravel (mostly quartz gravel), from 100 to 300 ft. deep, carrying considerable fine gold.

4. Yellow, decomposed bowlder stratum, very rich in coarse gold. This stratnm ie from 5 to 15 ft. thick.

5. Blue gravel lying npon the bedrock. Thie etratum is from 10 to 70 ft. thick, and in placee is very rich. It is composed mostly of large howldere. During the former ownerehip the mine was worked down to thie blue gravel or coaree howlder stratum.

Under the preeent management, the blue gravel etratum hae heen worked in eeveral parte of the mine by meane of three large and powerful water derricke. Thie work continuee day and night, the night work being carried on by meane of two electric lighte having 8,000-candle power each.

Ahout a year ago, the company decided to rnn a new tunnel which would be deep enough to work all the hydraulic ground owned hy the company.

Under the eupervieion of the company's engineer, ehafts were enuk npon the gronnd already worked to determine the poeition of the bedrock or deptb of gravel remaining unworked. Three ehafte were eunk and a body of gravel from 50 to 70 ft. deep was developed.

The finding of gravel of eo great a depth, which proved npon teete to be rich in gold, was a snrprise to all intereeted, for the general belief was that the gravel had been waehed nearly to the bedrock.

The bottom gravel in tbe eonth end of the claim, where the shafts were enuk, ie without any undne proportion of bowldere, and can be worked rapidly and oheaply by hydraulic proceee.

The company owne a large area of ground, which ie covered with baealt caprock. It ie the intention to commence drifting thie part of the mine. Thie work will be commenced in tbe near futnre, and will give employment to a large force of men. The nnmber of men now employed ie over 200, no Chinese being employed.

The New Tunnel.

In order, therefore, to be able to work the rich hottom gravel above mentioned, the new tnnnel muet firet be completed.

Thie tunnel will be 100 ft. deeper than preeent workinge. The tunnel was etarted on the 25th of January last. Bnt little work wae done until the 12th of March, when the firet mechine drille were etarted.

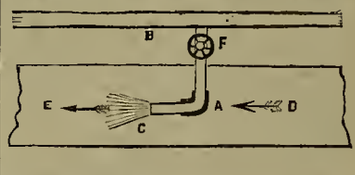
The eize of the tnnnel is 10 by 10 ft. and the total length about 3,000 ft. The grade at the lower end ie 6 in. to 16 ft., and 7 in. to 16 ft. at the upper end. In order to expedite the conetrnctiou of the tunnel it wae determined to eink two ehafte, and run the tunnel from five faces or headinge. The accompanying eketch will show the relative position of ths ehafte, from the compreseors on the eurface to the drills at the headinge. At each ehaft there ie a No. 3 Hooker pnmp driven hy compreseed air. The water which accumulatee in the down grade headinge, ie forced up to the enmp at the ehafte by meane of No. 2 Hooker pumpe.

CANAL FOR CONVEYING MINING DEBRIS.

Ventilation.

The queetion of ventilation ie one of great moment in tunnel work. It wae fonnd that the amount of air forced into the headings by meane of the air compreeeore wae ineufficient to give good ventilation. A eimple and eomewhat novel method of ventilatiou wae adopted, by meane of a half-inch gee pipe, *A*, tapped into the main line of pipe, *B*, leading from the compreesore; a jet of air under a preeeure of 60 or 70 lbs. is let into an 11 in. galvanized iron pipe *DE* (or a wooden air box can be ueed, bnt the friction will be mnch greater), with the outlet *C* of the pipe turned towarde the heading. By opening the valve, *F*, a strong current of air is drawn into the pipe at the end, *D*, and forced to the face of the tunnel.

In thie manner the air at the heading, where all the work ie performed, eoon hecomee clear after blaeting. The principle is similar to that of the Craneton elevator only that air takee the place of water.



Ventilating Appartus for Tunnel.

It ie expected that the tunnel will be completed hy the first of January, the average headway being about 17 ft. a day, and that by the first of March washing will he commenced on the rich hottom etratum which ie now inacceeeible.

The number of men employed on the tunnel work is about 80. Taking into coneideration the number of men employed and the amonnt of giant powder ueed in hlasting, it ie a fact worthy of note that no accident hae happened hy which any one hae been injured.

Debris and Levees.

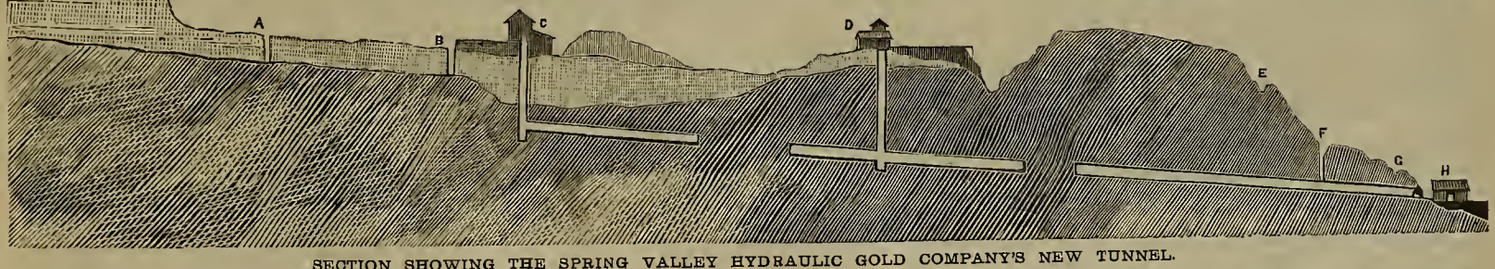
The greater part of the debrie from the river ie retained upon the company's land in the neighborhood of the mill, where the company owne ahout 6,000 acree.

The slickene or eediment held in euspeneion ie carried to the tule lands near the Sacramento river, by means of a leveed canal 400 ft. wide, with euh-levees 20 ft. between hanks. One of the engravinge ehowe the canal and euh-levees.

The object of the sub-levees (ae they are termed), *B*, *B*, ie to etrengthen the main levees *a a*, and at the same time to cauee the wafer to deposit ite eediment hetween the two emhankmente *A*, and *B*, and fill the epace, *D*. This ie accomplished hy putting dams acroes the water course, *D*, so ae to retard the velocity of the water. In this manner nearly all the eediment ie depoeited in the eide canale hefore the water reachee the tule lands. The canal commencee at the Cnnm dam, which is about eix milee from the mine, and extends for a dietance of nearly 30 milee.

During the winter months the canal becomes

[CONTINUED ON PAGE 452.]



SECTION SHOWING THE SPRING VALLEY HYDRAULIC GOLD COMPANY'S NEW TUNNEL.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Hydraulic Mining Question.

Another and Practical View of the Case.

EDITORS PRESS:—So much has been said on the hydraulic mining industry in the trials of the several suits growing out of its prosecution, so much written and published in the newspapers and other periodicals of California, that it would seem as if the subject had been exhausted on both sides—and nothing but a reiteration of facts already many times presented was possible. Still with all that has been said and written on the subject, there exists among the great number of those who are unfamiliar with it from personal observation, a misapprehension of some of the most important facts concerning it. Stated in a general way these facts are those showing the absolute and relative value of hydraulic mining to the localities in which it is carried on, and the necessity of its prosecution to those localities. Deducible from the preceding the effect of its permanent stoppage, it has become the rule among the newspapers devoted to the agricultural interests of the State, and also many of the metropolitan journals whose self-imposed function it is to act as whippers-in to public opinion, to decry the importance of the mining industry. It is gravely asserted by them that mining is on the decrease, that the mines are nearly all worked out and those still operated do not pay any profit. Comparisons are instituted between the mining of 20 years ago and that of the present time, which on their face would seem to sustain these assertions. Other comparisons are made between the yield of gold and that of wheat and other agricultural products to show that mining is of the far less relative importance and is becoming more and more so every year. Superficially considered these assertions and comparisons do very well to convince those whose knowledge of mining has been acquired from an intimate acquaintance with the fluctuations of the stock market, and those who know nothing at all but have opposing interests, that mining is of no importance, and that where it happens to conflict with other interests, as for example the agricultural and swamp land reclamation, it should give way to them. The reasoning is quite plausible and might be conclusive if the premises presented were fair and just. But they are not. The mining industry is carried on from an entirely different standpoint and on entirely different principles from agriculture or any other of the great productive industries, and the conditions have been and are so peculiarly anomalous here in California that the comparisons ordinarily instituted are not at all fair to mining. The limits and scope of this article precludes further discussion of this interesting phase of the subject, though it will be indirectly referred to in another connection further on.

By far the greater number of the gravel or placer mines worked by hydraulicing are situated in Plumas, Butte, Sierra, Yuba, Nevada, Placer and El Dorado counties, drained by the Feather, Yuba, Bear and American rivers and their tributaries, and discharging their combined waters through the Sacramento river into the San Francisco bay and thence to the ocean. Some few, comparatively, are situated in Amador, Calaveras, Stanislaus, and Tuolumne counties, drained by the tributaries of the San Joaquin river, and still fewer far to the north in Del Norte, Trinity, Siskiyou, Shasta and Tehama counties, drained by the Klamath and upper Sacramento rivers. Only in the seven first named counties is hydraulic mining of great importance and only in those counties has its prosecution entailed any damage to the agricultural interests of the valley counties.

The purpose of this article is as before stated to present the relative and absolute value of the industry (hydraulic mining), and the necessity of its prosecution to the localities where followed as the principal business, and more particularly the effect of immediate and permanent stoppage. To more clearly and comprehensively show the importance of considering the facts, I have selected one county and shall consider them with reference only to that county. Of the before named seven counties, Placer county ranks fifth in the importance of the hydraulic mining industry. Nevada, Yuba, Sierra and Butte in about the order named exceeding it both in the amount of capital invested and the annual yield. What may be said of hydraulic mining in Placer county applies in the other counties named. Having excellent facilities for obtaining the necessary data in the former I present it as typical of the others.

Placer county is situated in about the middle of the gold mining counties of the State. Its western boundary is in the valley plains about 15 miles from the base of the foothills. From there it extends in a northeasterly and easterly direction, nearly 100 miles to the eastern boundary of the State. In width it varies from 10 to 30 miles. The area is about —— square miles, and the population, by the last census, about 14,200. The northern boundary is in part Bear river, the southern the Middle Fork of the American river, the greater portion of the drainage being into the latter stream through its numerous tributaries. The western portion of the county lying between these two rivers is drained by several small streams, of which Auburn and Doty's ravines and Rock and Coon creeks are the most important. Industrially considered, three main geographical divisions may be made of the county. The extreme western, consisting of the valley plains and extending to the commencement of the foothills, is almost exclusively agricultural, there being no mining carried on, and only one manufacturing enterprise, a pottery, in the division. Grain is the principal production, an excellent quality being raised, though the yield per acre is not large. This portion of the county, comprising about one-seventh of the total area and about one-half the productive arable area, supports three small towns—Rosevills, Lincoln and Sheridan—situated on the line of the Oregon and California railroad. The total population at the present time does not exceed 3,000. The eastern division, comprising nearly one-half the total area of the county, consists of high mountains, deep canyons, beautiful lakes and mountain streams, and is only valuable where the timber is accessible. The permanent population, scattered in a few railroad stations and at sawmills, does not exceed 200 to 300. A few mines are known, but as yet have only been prospected. The central section comprises nearly one-third of the total area, and supports a population of nearly 11,000. The western third of this division, consisting of the lower foothills, up to an elevation of from 1,500 to 1,700 ft., contained rich surface placers, long since worked out and abandoned. A few gravel mines are still worked on a small scale, but are unimportant. The principal mining industry at the present time is the development of the numerous auriferous quartz ledges. These lower foothills, utilizing the water from ditches dug originally for mining, contain many small farms devoted to fruit culture. Hay and stock also figure extensively in the gross product. The eastern third of this division is the region of the great auriferous channel gravel deposits, which are worked by hydraulicing and drifting. Some few quartz mines have been discovered and prospected, but only one, the Rising Sun, at Colfax, has been permanently worked. Between these two sections is the remaining third of this division, poor in both mineral and agricultural resources. The iron mine and smelting furnace at Hotaling is the only important metallurgical enterprise. The comparatively small and scattered population is supported by the cutting of timber for fuel and the raising of hay and stock. As to the distribution of population and industry: In the agricultural and semi-agricultural portion of this division the population is concentrated along the line of the railroad, a certain portion receiving its support from it. The towns are Rocklin, Penryn, Newcastle, Ophir, Auburn, the county seat, and Colfax. Rocklin is a railroad town; Penryn receives its support from the granite quarries; Newcastle is the shipping point for the fruit-growing industry; Auburn and Ophir are in part dependent on quartz mining, as yet in its infancy in this section; and the town of Colfax is a railroad junction and shipping point for mines to the southeast. A population of at least 6,000 is concentrated in these towns, and engaged in mining or agriculture in the immediate vicinity. Of this number probably 1,000 derive all or part of their income from the hydraulic and drift mines higher up in the mountains.

As to the location of the gravel mining industry: Auburn is the distributing point to mines in the southern part of the county, and what is locally known as the Forest Hill Divide, which lies between the Middle Fork of the American river on the south, and the North Fork of the American river and Shirttail canyon on the north. The road from Auburn crossing the North Fork just above its junction with the Middle Fork, and climbing the Divide, runs for 15 miles through a sparsely settled country. The inhabitants find their principal support in the travel over the road. Fifteen miles from Auburn auriferous gravel begins to appear, until Todd's Valley is reached—20 miles from Auburn—but few mines are seen. The deposits worked are comparatively shallow and have been hydraulicked wherever possible. During the winter they still employ a few men. At Todd's Valley are the large hydraulic mines of Pond & Co., employing, when running, directly and indirectly, about 50 men. At Forest Hill, 23 miles from Auburn is one large hydraulic mine, the Dardanelles, employing 60 men. Several drift mines are also worked. At Yankee Jim, three miles north of Forest Hill, the mining is principally by drifting. At Bath, two miles northeast, is the Paragon mine, at present worked by drifting; some hydraulicing has been done. At Michigan Bluff there are several hydralic mines, and in the vicinity of these towns 10 or 15 others of minor importance, and occasionally operated. What is locally known as the Iowa Hill Divide lies between the North Fork of the American river on the north and Shirttail canyon on the south. The only town is Iowa Hill, eight miles southeast of Colfax, around which are many hydraulic and drift mines, the former predominating in importance, both from the capital and labor employed and the gross yield. Around the towns of Dutch Flat, Gold Run and Alta, the former being the second town in this county in point of population, are the largest and most important hydraulic mines in the country. Very little or no drift mining is done. On the Iowa Hill and Forest Hill Divide about three-fifths of the total yield of gold is from the drift mines, the remainder from the hydraulic. The preponderance of the yield of the drift mines is due to the fact that they are worked throughout the entire year, while the working of the hydraulic mines is confined to a water season of from 100 to 125 days. The total population of this portion of the county is nearly 5,000, all of whom are directly or indirectly dependent on the gravel mines. The value of the mining property, that is the mines themselves, the improvements, pipes, sluices, etc., the water ditches and rights, and necessary buildings, at an extremely low appraisement foot up over $1,500,000. The other land and improvements receiving their value indirectly from the presence and operating of the mines, consisting of town property, saw mills, mountain farms, roads, etc., valued equally low amount to at least $500,000.

Consider now the effect of the permanent stoppage of hydraulic mining. Of the $2,000,000 of property just mentioned at least $1,600,000 or four-fifths of the total would be wiped out of existence, the remaining fifth representing the value of the drift mining industry and dependencies. Of 5,000 of population at least 3,500 would find their occupation gone, be compelled to remove elsewhere and seek new occupations. The present hydraulic mines cannot all be worked by drifting as is claimed, the conditions as compared with hydraulic mining being very different.

The towns of Todd's Valley, Iowa Hill, Gold Run, and Dutch Flat would be almost completely depopulated. Forest Hill, Michigan Bluffs and Yankee Jims would lose about 60% of population. Bath, Sunny South and Damascus, all very small places, entirely supported by drift mines, would not be affected. Colfax and Auburn would lose considerable trade, and many of the small farmers in the foothills receiving their principal income from the sale of hay and produce to the miners would be affected.

Briefly summarized the effects on the county would be about as follows: A certain irrecoverable loss of at least one-fourth of the population; a reduction of one-third in the net incomes of another fourth; the practical destruction of $1,500,000 of property and reduction in the value of nearly all property not exclusively agricultural. This, beyond all question, would be the final result of the stoppage of hydraulic mining. Can the county of Placer stand it? And if Placer county, much more favorably situated than her sister mining counties with regard to hydraulic mining, finds these results disastrous in the extreme, what will be the result in them with their far greater vested interests? Because these results do not occur in a day they are none the less certain; 30% of their effects would be felt the first year, 50% the second, and the third year the remainder. Some of these have been felt already, the enforced idleness and uncertainty of the future having a tendency to depress values. The assessment roll shows in Placer county a reduction of nearly half a million in the value of the gravel mining property directly due to these causes.

Becoming more general in the discussion, the testimony in the debris case now on trial at Sacramento, shows the gross product of the hydraulic mines to be from $14,000,000 to $17,000,000 annually. This may fairly be held to represent from $50,000,000 to $70,000,000 of directly invested capital; indirectly there will be as much more invested within, as well as within the mining districts dependent on the industry. Admit that the State can stand the loss of fixed capital represented by the figures given above, and within at the most five years, can it stand the sudden cessation of annual income to the amount of $14,000,000? Does that sum bear so small a ratio to the total income of the State that its loss will not be felt? Only the greatest ignorance of the resources of the State would attempt to sustain such a view. San Francisco and California would beyond all question be seriously crippled by this loss of income. Every industry, with the possible exception of the purely agricultural and even that by sympathy, would suffer great damage.

The figures I have given may be rather more relative than exact, but at any rate are underestimated. The very slight and superficial presentation I have made of the subject is all that is possible within the limits of this article. If it lead to a more thorough and exact examination of the facts I have called attention to, it will have accomplished its object.

RUSSELL L. DUNN.

Auburn, Dec. 19th.

Sawtooth Mines.

EDITORS PRESS:—A few items of interest concerning the mines of this already famous quartz district would be acceptable to your many readers. Sawtooth mining district embraces quite an extensive piece of country, being over 100 miles long by nearly the same broad. The main producing portion of this district is what is known as Smiley and Beaver canyons, both being near each other, in fact adjoining canyons. Smiley is situated about 12 miles from the head of Big Wood River, being divided by a range of high mountains known as the "Wood River Divide." It is at nearly the head of the main Salmon river that Smiley gulch commences to run south and continues for a distance of five miles as a broad open valley with the creek called Smiley in the center. The gulch itself is probably 10 miles long, and becomes narrower as one ascends. When nearly at its head the surrounding mountains come into the shape of a horseshoe, forming what is known as Smiley basin. Here it is that the Mountain King, Vienna, Solace, Emma, Lucre, Hidden Treasure, Wisconsin, Nellie group, Alturas, Justice, and many other rich mines are located. The greatest of these is the Mountain King, owned in Minnesota, and managed by C. J. Johnston; he and his brother, Frank A. Johnston, are largely interested, both in this and the Vienna, another excellent piece of property. The Solace is owned in your city by Haggin & Tevis, and the showing on the surface is certainly a good one for an excellent piece of property when depth is attained. The Emma is owned by L. Smiley, the discoverer of the district, who richly deserves the rich property which he is possessed of. The Nellie group is operated by W. H. Brodhead and owned by New York parties. The Alturas and Justice is in the group known as the Vienna group, both mines having large bodies of good ore awaiting the erection of the company's 40-stamp mill in the spring. The Lucre has a fine surface showing, though of a lower grade, it will on account of the immense quantity, pay to mill, being conveniently situated. The Hidden Treasure and Wisconsin are extensions of the Mountain King, both showing an immense ledge and good ore of perhaps 8 ft. in width. Smiley has in promises to fulfill every expectation of the hardy and persevering men who are trying to bring it out. Not a little of this credit is due to the brothers Chris and Frank Johnston, who in the face of many hardships and at their own expense developed the Vienna, the first mine really opened up enough to show that at 500 ft. the ore was as rich and the bodies as large as on the surface. They have now got their reward in the Mountain King and Vienna group, both having sufficient first-class ore to keep their 40-stamp mill running night and day. Mr. L. Smiley also deserves special mention in this respect. Mr. Smiley is a hard working and energetic miner, as well as a thorough gentleman; to his steady and persevering work is due the opening of his claim to such a depth that proves beyond a doubt that the Emma ranks high among the paying ones of this camp.

The new mining town of Vienna is situated about two miles from the principal mines, and promises fair to be another Virginia City. Some very prominent merchants intend opening up large warehouses in the spring.

At the foot of Beaver canyon, about three miles from the main Salmon river and about two miles from Smiley gulch, lies the town of Sawtooth, in summer numbering a population of about 1,000 people, four good outfitting stores, sight or ten saloons, three restaurants, one butcher shop, one livery stable and a hurdy-house, comprises the business portion. A daily mail arrives and departs, in summer on wheels and winter on runners, carrying passengers and express freight. Two miles above Sawtooth City is situated the first stamp mill erected in the district, being owned by the Columbia and Beaver and Lucky Boy companies, of New York. The mill is a 20 stamp and as fine a structure as can be found in any camp. It was erected by Mr. J. K. Owens of your city—"Jim," certainly ranks high as a mill builder. Comfortable quarters for officers and men are erected. The Secretary, Mr. C. W. Cortright, was here during the erection of the mill, devoting all his time and energy to the promotion of his company's interest. Three miles above the company mill is their mines the Columbia and Beaver. The former is probably the most developed mine in the canyon, exclusive of the "Pilgrim," being opened by three different tunnels, each being some 200 ft. in length, running on the ledge bearing fine bodies of ore for stoping. They have commenced running a fourth tunnel some 500 ft. from the lowest. When this tunnel taps the ledge (it being a cross-cut) it will be as fine a developed piece of property as there is in the district.

The developments on the Columbia and Beaver during the past summer has demonstrated that they are exceedingly valuable mines that will add largely to the bullion output the coming summer. I believe they are at present under the management of Mr. J. R. Gowan, of Utah. The Pilgrim mine owned in California and managed by Mr. J. L. Richardson, is one of the best claims in Beaver gulch, being well developed by shafts and tunnels and proved valuable at 300 ft. depth, the ore there being richer and of larger quantity than on the surface. Probably 1,000 tons of ore await crushing in the spring. The Bidwell and Beaver Extension companies, of New York, have quite an extensive body of ore in their claim. These mines have only been developed this past summer, but so far they promise well. They are managed here by Mr. Gardiner Adams of your city. There are a great many more of good repute, that when the snow clears off work will be resumed. The ores of Sawtooth are the best of milling ores, carrying antimonial silver and black sulphurets and some gold, and require roasting for successful amalgamation. This is a fine mineral country and I am confident that within another year Sawtooth will rank as the leading quartz camp on the coast. "VOXPOPULI."

Sawtooth City, Alturas Co., Idaho, Dec. 13.

INDEPENDENCE, a mining camp west of Denver, has for a long time been overrun with desperate characters, who kept it in a perpetual state of turmoil. Shortly after dark, Friday night, Patton and Malloy, two desperadoes, started up the street, firing revolvere promiscuously. The people turned out *en masse* and pursued the desperadoes, who were finally brought to bay, and literally riddled with bullets.

Mechanical Progress.

Drilling Machines Operated by Electricity.

Mr. J. H. Thomson, of Shoeburyness, England, recently proposed a new method of working drilling machines. He recommends the use of drilling machines operated hy electricity, the drill being contained in a metal frame, in the central part of which are fitted two revolving drill spindles, one within the other, the larger being hollow and the smaller one solid. The small spindle has at its end a shoulder on which a drill or bit is fitted, and prevented from turning on the spindle by means of a feather and slot. Another drill or bit is similarly fitted onto a shoulder on the hollow spindle, and is made hollow to allow of the drill or bit on the small spindle revolving within it. The revolving spindles are driven in opposite directions, each having fixed to it a bevel-toothed wheel, which two wheels gear into, and operated by two bevel pinions, each fixed to a tubular part or sleeve, made so as to revolve on a fixed axis, at right angles to the revolving spindles, such axis passing from side to side of the frame, an aperture through the same being provided for the small drill spindle to work in. To each of the loose tubular parts or sleeves is fixed a disk, to which eight pairs of iron bars are connected. The said bars are wound with insulated wire so as to form electro-magnets. These in turn attract armatures fixed to the frame. The electric current is admitted through a terminal, whence it passes to a contact maker, thence to brushes, and from these latter to insulated rings, each split into eight parts, to correspond to the magnet, and so arranged that only those magnets are in action which are approaching the armatures. From the magnets the electric current passes to another set of insulated rings, and thence by the brushes to a terminal. The connecting wires pass along the frame of the machine. Suitable handles are provided by which the operator may hold and work the machine. If the diameter of the small drill or bit be in the ratio of 794 (or thereabouts) to the diameter of the larger drill or bit, the two drills or bits will counteract each other, and the frame will not have a tendency to turn round. Single drills or bits may, however, be employed when (as in the case of small work) convenient.

Glass Roofing and Siding.

The short-lived nature of the more common materials employed for roofing purposes is so patent that any material approximating a greater degree of perfection, beauty, utility and durability, must meet with general commendation. Glass has been prepared to meet this want, and a manufactory has been started to produce it in large quantity. The manufacturers claim for this roofing not only superior beauty, but also superiority and convenience for all purposes over any other kind of roofing now in use. It is claimed that this roofing is stronger than slate and one-half lighter, that it will not disintegrate or shrink, and that it will not absorb moisture, there being no capillary attraction. The manufacturers also contend that practical tests have amply demonstrated that it is cooler in summer and warmer in winter than any other roofing, its corrugated surface reflecting and radiating the rays of heat. It can be laid on open sheathing or laths, shedding light without exposing objects to men from within or without, or it can be laid on tight sheathing as may be desired. It can be made of any color, variegated or materialized to suit the fancy. The peculiar shape of the shingles produces a wavy appearance, greatly enhancing its beauty, and at the same time providing a bearing for all parts of the shingle. It is fastened to the sheathing as a roofing or on sides of buildings as a siding, with nails made for that purpose, or with screws, the former being preferable. Not a nail or screw is exposed to view from gable to gable, each nail or screw being covered and protected from the elements by the nose or point of the overlapping shingle. A broken shingle can be readily replaced. No cement, putty, or other substance is employed in laying this roofing. Filling may be used between the sheathing and the shingles if desired.

Tinkering.

An unfortunate weakness of some in charge of machinery is a desire to be constantly tinkering at it, under the mistaken impression that they are improving its performance. The reverse is the truth oftener than otherwise. With new engines and machines it sometimes happens that the parts chafe a little through some oversight in fitting up, and require to be eased, but when it comes to resetting valves and general overhauling, though they may be instances where it is required, in most cases it is a mistake to attempt it.

Here and there, perhaps, a little slide valve engine has been set cold, so that when it gets to work hot, the valve does not work properly; but most automatic engines, we might doubtless say all, have been correctly set by the indicator before being sent out of the shop, and no one can correct their performance by merely guessing at what is going on in the cylinder, and assuming that the performance can be improved by shifting the eccentrics hap-hazard.

Engines which require the fewest repairs are those that have had the least tinkering done upon them, and that, as a rule, applies all over. It is the same in the machine shop, some are eternally on bad terms with their lathes or shapers, or planers. We recall one man who was so often upon his knees about his lathe and had so many quarrels with its performance, that he gained a nickname which stood in lieu of his proper one, and after all his fussing with his lead-screw and feed-gear, and cone-pulley, and bearings he did the poorest work in the shop. Perhaps, because he was a tinker.

It is a good thing to know when a machine is in order and to keep it so; in other words, "let well enough alone."—*Ex.*

An Elastic Lacquer.

According to the *English Mechanic*, a patent has been taken out in Germany for a new description of elastic lacquer, which will not peel off, and which is suitable for the coating of carriage-cloths, plans, and other articles to be rolled or folded, as well as for wood and iron-work, walls, etc. It may also be employed as an isolating layer for damp rooms, as a means against dry rot, and in rendering stuffs waterproof.

To produce the lacquer, 50 kg. of linseed-oil varnish are heated up to boiling point. In another vessel about 15 kg. of lime are slaked in 20 kg. of water. As soon as the lime boils, about 50 kg. of hot melted raw caoutchouc are added to the lime water, and the whole is then stirred until it has become thoroughly mixed. This composition is poured into the boiling varnish, the whole being stirred all the time. Further stirring takes place until a homogeneous mass is formed, which is afterward strained or filtered, and left to cool. After cooling, the lacquer has a pap-like consistency. To apply the lacquer it is diluted with the desired quantity of varnish, and put on with brushes, either in a warm or cold state; but it is said to be better to apply it warm, as then no varnish is required for diluting it. In rendering linen water-proof, the lacquer may be put on by means of brushes or rollers. After treatment, the linen or other stuffs, paper, etc., are hung up to dry. Stuffs are perfectly dry and ready for use in two days. The product is stated to be lustrous, elastic, not sticky, and perfectly water proof.

How Electric Wires are Covered.—Prof. A. E. Ayrton has recently devised a novel method of covering wires for electrical purposes, the process being merely a modified form of weaving. The wire, which may be German silver, platinum, silver, etc., or simply copper or iron, if chasmese may be desired, is wound bare on the shuttle and used as the weft, being woven backward and forward between parallel fibers of silk, cotton or any suitable material employed as the warp and the insulating material employed on the shuttle. The web, whether composed of a warp of wires and a weft of insulating material, or a warp of threads of insulating material and a weft of wire, may, if desired, be steeped in or passed through a bath of bitumen or melted paraffine wax or other similar liquid, and an extra security of insulation and solidity is thus secured. It may be rolled or twisted up sideways to be placed in the bath. The web or ribbon, in the flat state as woven, can be easily painted with any fluid compound if desired, an ordinary paint brush being employed for the purpose, or the web or ribbon may be covered with gutta-percha, or with some similar substance, by being passed through a die where the compound is under pressure.

Rapid Melting of Iron.—Mr. Thomas D. West, in regard to the rapid melting of iron, says: In my practice, whenever I wanted to melt rapidly, I always had my pig iron broken small, as pig iron melts at the ends first. If the pigs had too much sand on them, I would have it knocked or brushed off. The fuel should be free from all dirt. Instead of making the charges all the same weight throughout the heat, I would make every other two charges lighter. For instance, starting at 4,000 lbs. for the first charge, the last charge would be, according to the heat, from 2,000 to 1,000 lbs., as a cupola never is in as good condition for melting iron toward the latter end of the heat as at the first. This way of charging brings your fuel and iron closer together. In charging up, the fuel should be laid in loose, so that the flame can get a good chance at it, and the fuel should be put in compactly, so as to make a solid fire. The charges should never be allowed to get below the charging door until all the iron is in. It is also of great importance to use some oyster shells or limestone to clean the iron. The slag and dirt should be let out of the cupola when there is any collected.

A New Electric Light.—Two Frenchmen have recently introduced into Paris a new electric lamp which, because of its mellow luster, they call the "Sunlight." The light is formed by boring two conveying holes into a small brick of marble and inserting two carbon rods which nearly penetrate the brick and are separated at their point by a partition of the marble. Their upper ends are connected to the dynamo-electric machine, and the current in traversing the wall of marble between the points makes it white hot. The gas escapes by the bore holes, which are wider than the rods, while the light is emitted by the bottom of the brick, which becomes calcined.

Scientific Progress.

Some Facts About Comets.

The multiplicity of comets during the past year has attracted an unusual amount of attention and study to this class of celestial objects. Emile Dolaurier advances the hypothesis that the great rapidity of cometary motion causes the ethereal matter to vibrate and transforms it into light and heat. He expands his hypothesis so as to account for all the variations of form which the great comets undergo, for the apparent solar repulsion and for the curvature of the tail.

M. Praxmowski, from observations since 1858 by the spectroscope and polariscope, concludes in regard to

The Constitution of Comets,

That they are formed of a condensed portion, which constitutes the nucleus, surrounded by an incandescent gaseous atmosphere, containing carbon and reflecting solar light, and of a swarm of disaggregated material. This latter is not controlled by the cometary attraction, but moves in obedience to universal attraction. In some comets the polarization of the light is strongly marked, while in others it is almost wholly absent. In the latter case he compares the structure to that of atmospheric clouds.

Thollon has presented to the French Academy an account of some comparative observations upon

The Spectra of the Two Recent Comets,

The continuous spectrum predominating in the first, while in the second the three carbon bands were very well defined and very brilliant, but gradually faded upon the side of the violet, and he was unable to observe any slight traces of a continuous spectrum until the night of the 21st of August. The brilliancy of the head and tail varies rapidly with the distance from the sun. In the absence of any precise photometric measurements, the variations seemed to be nearly in the inverse ratio of the square of the distance. If this law should hold rigorously it would probably follow that the white lights of comets is almost entirely due to reflection of the sunlight. It seems hard to reconcile the slowness with which the brilliancy of the band spectrum varies with the common opinion that the elements of a comet are raised to incandescence by the sun's heat. Comets, like nebulæ, may have some heat and light of their own, independent of that which may come from solar, mechanical and electric action.

Phosphorescent Alumina.—Prof. Crookes has experimented with phosphorescent spectra in a nearly perfect vacuum. After operating for a long time upon chemically pure alumina which had been precipitated from the sulphate, he noticed a curious phenomenon. When the body was first inclosed in the vacuum it was of a snowy whiteness, but after having been exposed frequently to the molecular current, thus producing phosphorescent alumina, it gradually assumed a rosy tint, and after two years, when it was exposed to the solar light, it showed a trace of the aluminum line. Repeated molecular excitement gradually brings the amorphous powder into a crystalline form. If ammonia is added in great excess to a diluted solution of alum, a part of the alumina is precipitated. Separating it by filtration, igniting it and submitting it to the action of the molecular current, instead of giving a red light, it has a pale green phosphorescence, which, when examined with the prism, shows no lines, but simply a concentration of light in the green portion of the spectrum. In studying rubies, of which he examined an enormous number by his apparatus, Crookes had the good fortune to find a single crystal, which, although it presented no difference to the sight, gave a green light under the action of the molecular current. This green light, however, always has a trace of the red line, and if the action of the molecular current was continued for several minutes, the green phosphorescence faded and a red tint was produced.

Explosion of Bubbles.—Plateau has published some new experiments upon thin liquid films. One of the most interesting is one which furnishes conclusive evidence of the contraction which the bubble undergoes during its rapid destruction. He filled with tobacco smoke a bubble of glyceric liquid of about 11 centimeters (4.3 in.) in diameter and laid it upon a ring of 4 centimeters; waiting until the blue color of the summit showed that it was upon the point of bursting he pierced the summit with a metallic wire. The mass of smoke was thrown vertically for about a decimeter above the bubble and then spread horizontally, like an umbrella, and continued to mount more slowly while diffusing itself into air. The experiment was repeated several times with the same result.—*Acad. Royale Belge.*

Large Salt Deposit.—The opinion advanced by geologists on theoretical grounds that an enormous deposit of salt reaches from the Luneburger Heide to the coast of the Baltic, has been established by actual tests. Borings have shown that one branch of the deposit extends from Luneburg, under the Elbe, and across the Grand Duchy of Mecklenburg, and another in the direction of the Duchy of Holstein, by way of Legeberg to Elmeborn. In one place the salt is more than 130 meters thick.

Engraving by Electricity.—Electricity has within late years produced wonderful results in almost all branches of science. One of the latest achievements, successfully introduced by M. Plante, is engraving on glass by means of electricity, the process being as follows: The glass is laid in a horizontal position, and covered with a concentrated solution of nitrate of potash, the liquid being retained by a shallow vessel in which the glass is placed. A platinum wire is dipped in a horizontal position in the solution along the edges of the glass. The wire is attached to one of the poles of a secondary battery of 50 or 60 elements. The lines are traced by hand with the point of an insulated platinum wire connected with the other pole of the battery. The parts of the glass covered with the alkaline solution become engraved when touched with the end of the platinum wire, however rapidly this is moved, the thickness of the lines varying with the thickness of the wire. The current from either pole may be used in the writing wire.

Evidences of a Lunar Atmosphere.—Prof. Alexander brought forward at the last meeting of the National Academy of Sciences, a variety of evidence tending to indicate some envelope, like an atmosphere, for the moon. The evidence was principally drawn from observations during eclipses. The explanations usually offered for the bright band seen around the moon at such times were fully considered, and shown to be inadequate, though good as far as they would apply. The ruddy band of light is much too broad to be the sun's chromosphere. Various experiments proved that it was not a consequence of contrast alone. It was most apparent in those instances where the moon was nearest the earth. It could best be accounted for by supposing an atmosphere to the moon—a thin remnant of ancient nebulosity, comparable to that which accompanies the earth and gives rise to the appearance of the aurora borealis.

A Plan for Producing Rain.—A Capt. Campbell has been advancing a theory according to which rain can be produced whenever and wherever desired, so that a drouth-stricken locality may speedily find relief. He proposes to take a well already dug, and explode in it say 100 kegs of powder. The powder is to be arranged in such a manner that cotton layers or interstices will prevent the whole mass from exploding on the same instant, so that a continuous sheet of fire and confusion will be kept up for some little time, shooting up into the sky for a great distance, and producing such a concussion and condensation of moisture that he thinks a storm center would be soon formed and rain precipitated. He bases his singular theory on the observations he made on the result of the explosion of the Confederate ram at the time of the passage of the Mississippi forts by Farragut's fleet, and on the result of the Chicago fire.

Height of the Atmosphere.—Dr. A. Kerber has estimated the hight of the atmosphere from the phenomena of refraction. By two different methods he obtains hights of 189 and 192.6 kilometers (117.4 and 119.7 miles).—*Wied. Annal.*

In regard to the above the *Journal of the Franklin Institute* remarks: "Some of the observations upon meteors and auroras have led to the conclusion that the atmosphere reaches a hight of more than 500 miles. Laplace's limit of synchronous rotation would allow a possible hight of more than 26,000 miles. The theory of Fresnel and Grove, that the luminiferous æther is only a very tenuous atmosphere, would make the portion which belongs to the earth of the same hight as Laplace's limit."

Electrical Experiment.—The following simple electrical experiment is described in *L' Electricien*:—A small box of pasteboard is closed with a lid of fine glass, on the upper surface of which collodion is applied several times (but not so much as to render the lid opaque). In the box are placed insect forms, made of sponge or cotton. On rubbing the collodion surface with dry fingers in dry weather, the insects move about in a curious manner.

Living and Dead Protoplasm.—O. Loew finds from his investigations that living protoplasm possesses the property, in a high degree, of reducing metals from their solutions, but that this reducing power is lost by death. Hence it may be concluded that the mysterious phenomena of life are connected with peculiar groupings of atoms, possessed of special motions which are analogous to those of the aldehyde group.—*Pfluger's Archive.*

Improvement in Telegraphy.—An exhibition was made at the Paris Exhibition, by John Mackenzie, of an improvement in telegraphy, which promises to become of much importance. By this device it is claimed that any number from 1 to 999 can be automatically signalled on one wire by a single movement of the transmitter, so that on opening the box at the receiving station the number will be found correctly recorded.

Paraffin as an Insulator.—It is well known that paraffin is a good electrical insulator, but its being so soft has prevented its extensive use. Mr. W. J. Henley has so combined it with India rubber that the insulating power is increased without impairing the properties of the rubber.

The Mining Share Market.

There is very little doing in stocks. We are approaching the end of the year, when a large amount of money is withdrawn from speculation to satisfy collections, and another large sum of money has been absorbed in holiday trade. There is no development or prospect of a sudden development on the Comstock to create a speculative fever, and, although many of the mines are doing work at interesting points, the public is not expecting bonanzas.

The Combination pump will be run by hydraulic pressure, beginning next week, with the requisite force supplied by a natural flow of water from a tank on the mountain west of Virginia. It is thought that the change will effect a saving of from $50 to $60 per day.

A diamond drill hole is being run southwest from the west crosscut of the Gould & Curry and Best & Belcher mines to determine what lies in that direction.

At the Yellow Jacket mine they are cutting into very promising ground at several points, but as yet have only found low-grade ore. In the vein 300 ft. east of the Yellow Jacket shaft, the Sutro tunnel folks are finding ore that assays very well.

At the Savage two drill holes have been run up from the 2400 level to tap the bottom of the main incline. Neither appears to have hit the incline, but both are running large streams of water. A survey is being made for a third hole, which will soon be started.

Colorado mines paid $2,776,750 in dividends this far this year, as follows: Bonanza Develop Co., $135,000; Catalpa, $180,000; Chrysolyte, $500,000; Dunkin, $110,000; Evening Star, $425,000; Gem, $3,750; Glass Pendery, $25,000; Hibernia, $150,000; Iron Silver, $400,000; Leadville Co., $20,000; La Plata, $180,000; Morning Star, $50,000; Moore M. S. Co., $36,000; Polonia, $12,000; Robert E. Lee, $50,000; Rohinson Con., $450,000; Silver King, $50,000.

Local dividends (S. F.) for December amounted to $530,250 from mining companies against $608,000 in same month last year.

The dividends for Dec., 1879, amounted to $1,121,333, including $944,500 from the mines. This embraced $540,000 from the California and Consolidated Virginia and $100,800 from the Ophir.

YEAR BOOK OF SAN BENITO COUNTY.—We have received a copy of the Year Book of San Benito Co. for 1882, published by the Hollister *Democrat* and edited by Herr Wagner, a sprightly writer. The publication contains much information about the county, descriptions of its chief agricultural districts, record of local events in Hollister, statistics of leading products of the county. It bears on its face evidence of being a fair statement of the resources and industries of the county, and is no doubt a valuable work, worth thousands of dollars to the future progress of the thrifty section of the State it represents.

THE North Bloomfield and Milton Hydraulic mining companies paid taxes amounting to $15,026 in Nevada county.

Dos Cabezas.

EDITORS PRESS:—A letter from this place, in your issue of Dec. 17th, signed E., mentions my name. Efforts are being made here to make it appear that I am the writer of that letter. Will you please let me say that I did not write it, and I am not responsible for any of its statements. J. D. EMERSLEY.

Dos Cabezas, A. T., Dec. 24, 1881.

WEST POINT, CALAVERAS COUNTY.—Our mining interests were never in such a flourishing condition as they are at the present time. It appears, in almost every case, that as depth is attained the ore is found to be as rich as it was on or near the surface of the ground. 'Tis well known that West Point has been one of the richest quartz districts in the State; that is, so far as the surface diggings have been worked, and we hope in the near future to be able to say the same of the different mines here as depth is attained. There are a few of them that are now being worked, which fully proves them to be permanent quartz ledges, with enough gold in them to pay the capitalist for his investment therein. There are at present 14 of them in good working order. The Champion mine being the deepest heads the list.

MINING AND SCIENTIFIC PRESS.—The most valuable of all mining journals came to hand last evening much enlarged and improved in other respects. This number (Dec. 17) contains 21 pages of solid reading matter, with numerous fine illustrations, independent of the large amount of advertising. On the second page is an article from the pen of Geo. Madeira, entitled "From San Francisco to Tombstone." This is one of a series descriptive of Arizona that are to appear from week to week until the entire mining fields of Arizona are covered. In its mining summary is an epitome of our mining report of Dec. 11, as also notes from the various districts in the territory. This is a journal that no miner who desires to keep posted in all the fields of the Pacific coast should be without.—*Tombstone Epitaph.*

MILL AND MINE MACHINERY. — The well known manufacturers of improved and approved form of mill and mining machinery, Fraser & Chalmers of Chicago, Ill., have this week changed the advertisement that has been running so long in our columns, to a more comprehensive one, giving a list of the articles they make. Messrs. Fraser & Chalmers have opened a branch office at Room 32, Wall street, New York, with Walter McDermot as Manager. This firm is now prepared to take contracts for mining machinery or metallurgical appliances of any kind or size, being fully outfitted by extensive additions to shop and machinery.

JAS. C. FLOOD, the mining capitalist, gave his usual Christmas subscription of $6,000, divided as follows: Protestant orphan asylum, $1,000; Catholic orphan asylum, $1,000; Hebrew orphan asylum, $1,000; Ladies Protection and Relief Society, $1,000; San Rafael orphan boys, $1,000; Magdalen asylum, $500; San Francisco Benevolent Association, $250; Boys' and Girls' Aid Society, $250.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

GRAVEL.—*Monitor-Argus*, Dec. 26: The Alpine gravel claim miners are making good progress in the construction of their ditch. We are informed that already nearly a mile in length is finished.

BUTTE.

RED HILL.—Oroville *Mercury*, Dec. 23: We learn that this Co., whose property is situated upon the west branch of the Feather river, near Magalla, in this county, have just commenced piping. They have had during the past summer, a large force of men at work, and by an expenditure of $30,000, put in dams, flumes, giants, pipes, buildings, etc. They have also built dams for impounding all their debris within a few hundred ft of their claim, though, as we are informed, the nature of their ground is such that, taken in connection with their facilities for impounding debris, the water flowing over the dam will be almost, if not entirely, free from sediment. This is one of the oldest claims in the county, its location dating back to 1852, and since that time has been worked more or less, but only on a small scale. Now modern appliances are at work, under the direction of experienced miners, and we expect to see a creditable amount added to the already large yearly gold product of Butte county from the Red Hill Hydraulic Mining and Water Co.

CALAVERAS.

HYDRAULIC.—*Mountain Echo*, Dec. 20: The hydraulic spoken of in a recent issue of the *Echo*, as being nearly completed, is now in full operation. It is situated on Smith's Flat, about 2 miles west of Angels. The company made a run of a few days in order to prospect the ground, and a gentleman who saw them cleaning up, informs us that the claim is very rich. He saw 1 piece of gold which he should judge to weigh about 6 ounces, besides numerous smaller pieces. The mine was located many years ago, and has from time to time produced enormous quantities of gold.

WEST POINT.—Calaveras *Chronicle*, Dec. 24: Work in the Champion mine is progressing favorably. The owners are sinking their winze on the 700 level, and the mill is kept running night and day. The owners of the Lone Star are sinking a working shaft on that vein from the surface, and are taking out some splendid quartz while going down. The owners of the Florida have struck some fine specimen rock in the south drift of 190 level. They intend sinking the main shaft 200 ft deeper when fair weather returns. The Pride of Bummerville mine is running night and day, sinking their main shaft on good quartz; the water is very strong in this mine. The owners, Smith & Co, intend to sink till hard ground is struck. The present depth of the shaft is 70 ft, which at least will give them 40 ft stope on first-class rock. The old French lode will commence to turn out its metal shortly under the supervision of Mr. J. Gouldson. The owners of the Bismarck mine are taking out good rock. Mr. Carey has gone below for machinery for the Star of the West mine, which is the north extension of the old Zacatero mine. Messrs. Rose & Jenkins are erecting a mill on the old Henry lode. Brown & Co. are taking out rich rock from the Whisky lode. The Woodhouse mine is again to be put in running order under the supervision of Mr. Desmond. Mr. W. Steger & Co. are taking rich rock from the Anna mine, the south extension of the Lone Star; 30 tons of quartz on dumps with plenty more in the mine. Work on the Riverside mine is being steadily pushed forward. Mr. Bushman is still running the main tunnel of the Bull Frog mine with plenty of rich quartz in sight. About 12 tons of first-class ore on dumps. Our mills are all kept busy grinding quartz. 'Tis hard to get returns from them all. I have only received returns from 5 of the mines, namely, bullion shipments: Bowers mine, $150; Anna mine, $700; Whisky lode, $325; Sacramento mine, $352; Florida mine, $425; Placer mines, $732. Total, $2,684.

LAMPHEAR MINE.—A number of visitors from Stockton—parties interested in the Lamphear quartz mine near this place—were here this week inspecting the mine. They were Messrs. James Garwood, J. L. Mowbray, J. Jones and son, Mrs. Major J. A. Sheppard, Mr. H. C. Willis and wife, and Mr. Lovelace and wife. We understand that the parties were very well pleased with the appearance of the mine. The hoisting works are being put up rapidly, a number of teams are engaged in hauling the necessary material on the ground, and it is calculated that the works will be ready to commence operations by the latter part of next week.

EL DORADO.

SOLD.—Georgetown *Gazette*, Dec. 23: Jako Urey has sold his Mameluke quartz mine to T. Lehouf of this place. Mr. Urey has worked this seam mine continually for 5 years. He has, however, leased the mine and will work it as usual.

NEW MINE.—Messrs. Peck and Grant of Shasta and Trinity counties, two experienced quartz miners of whom we spoke a few weeks since as coming over to look into our quartz prospects, have already found a new mine in which they have obtained a half interest, a few miles above town. They are very much pleased with the lode, which prospects well wherever they have made tests for a distance of 2,000 ft. They have commenced active work in the development of the mine. They feel confident that they have got hold of one of the best mines in the State.

INYO.

THE KEYNOT.—Inyo *Independent*, Dec. 22: From points culled from private letters it may be safely stated that the Keynot mining transfer will shortly be accomplished.

WAUCOBA.—Mr. W. L. Fuller has received orders on Monday last to take a force of men and commence active operations at once upon the Waucoba district series of mines, belonging to the Waucoba M. Co. of New York. Mr. Fuller has been here some time awaiting the above order, which for some reason has been held back longer than he expected.

RUNNING.—The Modock furnaces at Lookout are in active operation, under the management of Supt. Thomas, putting out bullion worth from $600 to $700 per ton.

AT WORK.—Supt A Wingard arrived from San Francisco last week, and has put a force of men at work on the Green Monster mine, across the river from this place. It is not merely "assessment work," as the mine was patented some years ago, and some important developments may be looked for.

MARIPOSA.

NO. NINE.—Mariposa *Herald*, Dec. 24: This mine, owned by Huling's & Son, and under the name of the Yosemite Co., is running prosperously. The mill, which is of 30 stamps, crushes about 4 tons of rock per 24 hours. Fifty-five men are employed and take out ore enough to supply the mill. The rock pays from $6 to $8 per ton. It costs $4 per ton to take the ore out of the mine and extract the metal, leaving from $2 to $4 per ton profit exclusive of the wear of machinery. The men of families who worked at the Washington have been employed at the No. 9, and have moved their houses from the former to the latter place.

MT. GAINS.—This mine, owned by E. Marcot and others, has been taken in charge by Mr. Hulings, of the Yosemite Co., and 10 men will soon be at work there. Mr. Hulings is to put $4,000 worth of machinery and labor on the mine and after testing the ore, is to have the option of buying it for $4,000. In case he does not buy, the improvements are to belong to the present owner. The plan now is to sink a shaft about 250 ft. deep to the vein. The result is likely to show sufficient inducements to cause Mr. Hulings to make the purchase.

WASHINGTON.—The mill at this mine will run for 3

months yet, crushing ore which is now being removed from the pillars in the mine. The machinery will eventually be sold out or shipped below. Some of it has already been shipped. The desire to sell the machinery furnishes an excellent opportunity for those desiring to develop mines to invest in an outfit.

EUREKA.—Work has been progressing on the Eureka mine under the direction of a Mr. Morris. He is fitting up the Campodonico mill preparatory to making a test of the ore from the Eureka.

POOL MINE.—Hon. D. M. Pool has 2 men at work on his mine. The ore recently taken out appears well and gives promise of a rich development. From a Coulterville correspondence dated Dec. 17, 1881, we learn that the Brooklyn mine is progressing finely. Tunnel in 170, with favorable indications. The machinery of the Mariposa mills and M. Co., for the Reed Talc mine is partly on the ground and the prospects are that everything will be in working order inside of 3 weeks. W. H. Swaine, of Cockade gulch, was in town last Saturday. He informs us that, while out hunting deer one day last week, he accidentally stumbled over a piece of gold that weighed $105. Swaine is one of the most lucky miners in the county. The new air compressor now used in connection with the Hite mine, continues to work finely. The power is taken from the river a mile distant from the mine. One of the drilling machines run by these compressors can do as much work as 10 men.

NEVADA.

THE PROVIDENCE MINE.—Nevada *Transcript*, Dec. 26: The 40-stamp mill at the Providence mine is in operation night and day, crushing 100 tons of ore every 24 hours. The new arrangement by which water is brought from the Snow Mountain ditch through 1,000 ft of 22-inch pipe works to a charm. It is believed that 90 inches of water, or 10 inches less than is now being used, will furnish sufficient motive power, the fall being nearly 400 ft. In the spring the owners of the Providence will double their present crushing capacity by building another 40-stamp mill.

PAYING WELL.—The Gold Flat Eureka quartz mine, upon which work was begun a few months since by a company of Nevada City and Grass Valley gentlemen, with John Trenberth as superintendent, is making a good record for itself. Eighteen tons of ore just crushed yielded $979 in free gold and about $100 worth of sulphurets. The ledge is a ft wide, and the 0 men employed take out about three tons a day.

PLACER.

EUREKA.—Placer *Argus*, Dec. 24: The Eureka drift gravel mining company is the name of a new mine located in east El Dorado canyon, near Damascus. The stockholders are chiefly San Francisco capitalists who incorporated the company on the 12th of October last. The superintendent is Mr. F. Cheppellet, of the Mayflower mine, Forest Hill. Work is being pushed rapidly and satisfactorily on the claim, we understand, a bedrock tunnel, some 150 ft in length, having already been run, besides which a boarding-house (for the accommodation of the miners) and a blacksmith shop have been built. A road has also been constructed from the mine to Damascus, 3 miles distant. The prospects of the claim are considered very good, since every pan of earth taken out between the rock and the loam show pay colors.

PLUMAS.

CARIBOO MINES.—Plumas *National*, Dec. 24: A friend writing from the North Fork country, gives us the following news: The boys are all alive and well at the old camp, and most of them doing a land office business in the way of washing up. J. H. Thompson's claim is panning out big, all the way from $20 to $175 per day. Peck & Mather's claims are paying better than ever, and are proving a big bonanza to the lucky owners. Grton & Keep are driving ahead their main tunnel, with good prospects of striking the pay-grit soon. Wilson & Moore are making good big wages, with lots of good ground in front of them.

SHASTA.

IGO.—*Courier*, Dec. 24: Curtis Downer, now with Dunham & Leiter at Igo, was in town Sunday. He represents everything as flourishing in his locality, and says the mining outlook in that part of the county is of the most encouraging character, both as to quartz and gravel mines.

GRR.—Charles Johnson is engaged in hauling ore from the White Oak mine at Lower Springs to Waugh's arastra. When we see loads of ore passing through town the inquiry presents itself: Why do not some of our capitalists who have the prosperity of the town at heart, erect a good custom quartz mill and ore smelter here? Shasta is the center of one of the richest mineral districts in the State and such a mill would pay.

SIERRA.

MORE GRAVEL.—The Ruby M. Co., at Carriboo ravine, have been prospecting east and west from near the top of shaft No. 2. In the tunnel running west, between shaft 1 and 2, some gravel has been found, but so far as we can learn no prospect has yet been found. The 2 shafts are 400 ft apart, and this deposit lies between them, at a hight of some 60 ft above the main tunnel, which passes under it. No work is being done in the main tunnel at present. R. Davidson and Henry Morse, of Eureka, called on us the other day and report times rather dull just now in that noted mining camp.

EXTENSION.—One hundred and seventeen ounces was the yield of the Bald Mountain extension last week. The face of the main tunnel is in bedrock, and what is presumed to be the north rim of the pay channel. The main tunnel is now being turned east up the ridge, where in the breasts from the incline gang-ways are paying en ounce per day to the pick.

IN the Haskel Peak Gravel mine, three-quarters of what is taken out of the main tunnel (now 60 ft above bedrock) is washed quartz. We hope the persevering and energetic stockholders will soon make a lucky strike.

A PAYING MINE.—The Bald Mountain M. Co. last Saturday cleaned up, after one week s washing, 339 ounces of gold, which is worth over $0,305. This amount does not include all of the gold washed out, as only a portion of the sluices were cleaned up.

TUOLUMNE.

ANOTHER BIG STRIKE.—*Independent*, Dec. 24: We record this week another big strike by a party of miners, on the Divoli bonanza vein, in a northcesterly direction, and about half a mile distant from the Divoli shaft. One day the present week the prospectors brought to town a sack containing about 60 lbs., nearly all gold. The vein at this point, not being developed, it is impossible to tell the extent of their good fortune.

NEVADA.

WASHOE DISTRICT.

OPHIR.—*Enterprise*, Dec. 25: During the week 202 tons of ore were extracted from the croppings and 613 tons sent to the mills. The assays have not been received from the mills.

SIERRA NEVADA.—The chamber for the winze in crosscut No. 2, on the 2500 level, is about completed. On the 2700 level are cutting out a drain and timbering up the joint Union Con. drift. In the joint Union Con. winze are cutting out a tank pit at the 2800 level.

UNION SHAFT.—Are still repairing the drift running out to the Sutro tunnel on the 1600 level, casing timbers at and in the shaft and cutting out e hoh pit at the 2600 station.

CON. VIRGINIA.—Still clearing out and repairing drifts and winzes on the 1600 and 1700 levels, connecting with the old Con. Virginia shaft. On the 2500 level the joint California has been sunk and timbered 12 ft.

CALIFORNIA.—Are still cleaning out and repairing the drifts and winzes connecting with the old Con. Virginia shaft. On the 2500 level the joint Con Virginia winze was sunk and timbered 12 ft. On the 2700 level the joint Ophir east crosscut has been advanced 28 ft.

YELLOW JACKET.—During the past week, on the 228 level, the east crosscut from the south drift was extended 34 ft, making present length of same 76 ft; ground showing an increase of quartz giving low assays. On the 3000 level the east cross-drift is in from switch 332 ft, having made 40 ft during the week; face of same in porphyry with stringers of quartz and slight seepage of water. At a point 278 ft south of the same switch have started an east cross-drift, which is to-day in 35 ft, with ths face in dry porphyry.

CANDELARIA DISTRICT.

MOUNT DIABLO.—*True Fissure*, Dec. 24: There is but little change below the third level. The east drift from winze No. 3 is in 62 ft, and the ground is more favorable for ore. The east drift shows considerable improvement, the ground being of the same character as in the east drift on the next level below. There is a good prospect at this point, the samples of ore assaying $87.

NORTHERN BELLE.—During the week no addition has been made to the length of the west drift in the fourth shaft level, but near the face of the drift a crosscut has been started toward the north and is now in a distance of 12 ft, 8 ft of which are in low-grade ore, showing streaks assaying $100 and upwards. The average daily yield of ore from the mine has been about 61 tons. Bullion shipments for the week ending Dec. 21st, $19,053.23. Shipments on December account to Dec. 21st, $48,072.00.

LUCKY HILL.—The northeast drift has been advanced 83 ft and is now in vein matter of favorable appearance.

PRINCESS.—The work of getting the machinery into place has progressed very rapidly this week, and the wood work is fast approaching completion.

GALENA DISTRICT.

SALE OF MINING PROPERTY.—Lander *Free Press*: Capt. Dahlgren has succeeded in disposing of the Piumas and Goodwin mines at Galena, to an English company. The price received is not stated. These two claims are situated about one mile east of the town of Galena, and are very promising gold mines. A force of 10 men was put on last Monday to set things in shape for a thorough working of both claims the coming spring and summer. Capt Dahlgren will be the manager, with Lou Crunnagle as assistant.

GRANTSVILLE DISTRICT.

THE CENTENNIAL MINE.—*Bonanza*, Dec. 20. Work in the Centennial mine is being pushed vigorously under the formanship of Thomas K. Murphy, with the most encouraging results. Ore of a very good grade is being encountered which may develop into a bonanza at any moment, and if indications don't lie the prospects are extremely flattering.

ESMERALDA DISTRICT.

CORTEZ MINE.—Esmeralda *Herald*, Dec. 24: The main force is now employed in making the connection between the bottom of the incline and the point where the lower tunnel taps the ledge, and rapid progress is being made. Everywhere in the mine ore abounds, and is of good quality. We do not exaggerate when we remark there are millions in sight.

EUREKA DISTRICT.

CORLISS.—*Sentinel*, Dec 25: This mine has lately been visited by experienced mining men and pronounced by them one of the best prospects for an extensive and valuable mine on Prospect mountain. It is situated on the west side of the mountain and south of the Prospect mountain tunnel. There is now a small force of men at work, and as soon as the road is completed, which now reaches near the mine, the working force will be increased. This mine is owned by Senator Doolin, who is now in New York city on mining interests connected with this district. There is now quite a large amount of ore on the dump awaiting shipment.

SAFFORD DISTRICT.

GOOA.—Eureka *Sentinel*, Dec. 25: From O. H Smith, who came up to Eureka last night to spend the remainder of the winter here, the *Sentinel* gets the gratifying intelligence that the Onondaga people have received the returns from 32 tons of ore sent from their mine to Salt Lake for reduction. It averaged between $113 and $119. This clean-up of ore so cheaply obtained, $3,782, is the best thing ever yet heard from Safford. Everybody was paid off yesterday. Things are quiet in the camp. Three men are at work in the Onondaga, and there are about 30 men prospecting in the district.

SOUTH MOUNTAIN DISTRICT.

BULLION.—*Silver State*, Dec. 20: One of Peter Rask's teams arrived here yesterday, with 20 bars of base bullion from South Mountain. The bars average about 90 lbs each, and are said to contain about $30 each in silver, making the load worth about $6,000. They are marked South Mountain C. M. Co., and are the first that have been smelted since the furnaces started, about three weeks ago. Another load of bullion is on the way here on Harry Watson's team, and more teams have gone to the furnaces to load.

WASHINGTON DISTRICT.

THE DELONG MINE.—Grantsville *Bonanza*, Dec. 20: A J. Franklin has shipped several tons of ore from the De Long mine in Washington district to Salt Lake for reduction. The ore is very rich and will certainly give handsome returns. The mine is considered by all who have seen it one of the most valuable properties in Western Nye. Mr. Franklin has recently purchased an interest in it from Cherles DeLong.

ARIZONA.

COPPER QUEEN NOT SOLD.—*Epitaph*, Dec. 22: We are indebted to Mr. Arthur Laing for the full particulers of the reported sale of the Copper Queen mine. It appears that Mr. L. Zeckendorf, one of the owners, had written to parties in London about the mine, and had set a price upon the stock, which was $8 per share, or $2,000,000 for the property. These gentlemen sent out P. Taylor, Esq., of the firm of John Taylor & Sons, London, and Mr. Thom, a celebrated mining engineer, to examine the mine and make a report upon the same. They were accompanied to Bisbee by Mr. James Douglass, a mining expert of Pennsylvania. They returned from Bisbee last evening and took the down stage for Benson. They made a critical examination of the mine, which was found better than the *Epitaph* report upon the same some time ago, for the reason that a winze has been sunk upon the ore body 15 ft since we were in it, thereby adding that much to that in sight. Ore was selected by Messrs. Taylor and Thom, and a run of 15 tons of ingots made, which was in every way satisfactory. It is not known whether the London parties will take the mine at $8 per share or not. That will be a matter for after consideration.

TURKEY CREEK.—Arizona *Democrat*, Dec. 26: George Sines came in from his mine, the Compton, on Turkey creek. He brought with him about 200 lbs of assorted rock, which he has taken from the mine on assessment work. The ore has been assayed at the Prescott assay office, and shows $977.09 per ton. The Compton is a fine property and is opening up very well. It is on the same lead as the Trinity. McCann is at work on the Capital mine, and is taking out good ore. Henry Ashton is at work on the old Urfer claim, now owned by himself and J. L. Fisher. There is a fine body of ore in sight. There is a tunnel being run in on the Gliver Perry mine. This tunnel is to be run in 200 ft for the purpose of opening up the mine, which is now under bond to Eastern men. Mat. Van Winkle is opening up his claim on the divide near the Centennial mine. Messrs. Brady and Brown are sinking on the Peerless, and are taking out good ore, which they propose to have reduced at the Tuscumbia mill. In a word, this district and Big Bug district is now attracting a great deal of attention on the part of miners and capitalists. Joseph Crane, Esq., has just returned from the Davis mine and reports a fine showing on this old and favorite mine. He also paid a short visit to the Desoris mine and found Burton Foster surveying a tunnel location. The mine is attracting a large camp, and justly so. There is very rich ore in the mine, which is carefully sacked and then lowered into the mine. Mr. Crane says that no person, miner or otherwise, can fail to see that this is a very promising mine in every respect. John Stemmer reports a rich strike in Cherry creek; a gold and silver mine. The ore body is unusually large.

GLOBE NEWS.—*Silver Belt*, Dec. 24: South Pioneer Co. are making adobes to use in putting up their machinery over the new shaft. Ore just brought in from the drift being run north on the vein assays $270 per ton.

THE HOWARD mine is the topic of interest among the miners, who are loud in their praise of the mine. A drift has been run a short distance on the new discovery in bottom of shaft 90 ft deep. The ore is as rich as any produced from the mine. The near future of these two mines is that of dividend paying properties.

THE Mack Morris shipped on December account over $21,000, and will on the 20th inst. ship 9 bars more, making for the month $35,000, and will also ship $5,000 worth of concentrations.

REPSEY.—Mr. E. O. Keunedy and John D. Burgess have just returned from a visit to the new Repsey district, situate a few miles south of Riverside. They bring some nice looking specimens of copper ore, and say the ledges are large and give evidences of permanency. There are but a few prospectors in the district as yet. Those already there have laid out a town site—named the town "Repsey," and the principal thoroughfare "Red Dog Avenue." Outside of the copper ledges, there are in this district, immense ledges giving fair assays from the croppings, in gold and silver, and it is the opinion of those who have visited the camp that thers is a bright future for Repsey district.

TOMBSTONE M. & M. Co.—*Epitaph*, Dec. 24: The Combination mine is looking and yielding well, and the prospect work in this mine is bringing forth good results. Northwest shows as well as at last report. Goodenough is opening out a large body of ore on the 200 level. Stopes on the 160 level, Tough-nut mine, are looking well.

GRAND CENTRAL.—Beginning with the old works, the west crosscut on the 600 level is in 130 ft. Several small veins or stringers of ore have been cut within the last few days that give good assays. On the 500 level they have cut the ledge, having a two-ft vein of rich ore on the foot wall, and one 1 ft thick on the hanging wall, with 6 ft of low-grade ore intervening, thus making the ledge 9 ft wide at this point. Are drifting south on this body to intersect the winze, which will be done this week.

VIZINA.—Running a level east from the summer drift which is in good ore. The main drift is all in high-grade ore. The northeast drift is also yielding high grade ore. Hoisting 25 tons daily. The company has declared its regular monthly dividend of $20,000 with an extra dividend of $20,000 payable in New York on the 3d of January. After paying these dividends of $40,000, the company has a surplus of $100,000, or sufficient for 5 more dividends.

CONTENTION.—Flora Morrison shaft down 65 ft below the 400 level. Drifting on the 300 level still continues.

COPPER QUEEN, BISBEE.—Have sunk a winze 30 ft deep on the ore body from the third level, finding the ore as good es above. The company has declared dividend (No. 7) of 10 cents per share, $25,000, and an extra dividend of like amount, making a total to date of $200,000.

WASHINGTON.—Pinal *Drill*, Dec. 24: A good wagon road has been constructed to this mine, which is situated half a mile due north of the King. The Washington mine was located in 1875. The Washingtoo mine, like the Silver King, has ore from the very surface, in a small, rich streek. Assays as high as $2,500 are frequent, but the ore averages $1 0 a ton.

AMADOR.—Is situated on a parallel vein with the Mount Vlow. The assessment work has just been completed by going 10 ft further into the tunnel, which runs into a large reef of heavy dark sper. It seems to be crowded with talc gouges, seams and veins, indicating a very large ore body beyond. The ore gives good assays. The plan is to run the tunnel in deeper, and then crosscut, in order to find the main vein, as the ledge will become more settled at greeter depth.

SILVER DISTRICT.—Arizona *Sentinel*, Dec. 24: The Black Rock continues to improve. The output of ore is increasing and is of high grade. The vertical shaft on the Lost mine is being sunk as rapidly as possible. Black sulphurets and carbonate ores continue to be found in seams and kidneys.

COLORADO.

THE MANCHESTER LODE.—Georgetown *Courier*, Dec. 22: A good strike was made last week in the Manchester lode, in Spring gulch, about two and a half miles from Idaho springs, of 6 inches of clean copper ore, which assays over $88 in gold, silver and copper to the ton, carrying 37% copper. The lode is an extension of the Bleck lode, on which a valuable strike was made a short time ago, and is owned by the Idaho Springs G. & S. M. Co.

NEW CALCINERS.—Denver *News*, Dec. 23: The Miners' Smelting Co. are adding to their works two new calciners, and are also building a new ore house. Their gold refinery will be ready for work in about three weeks. The office and assay department of the company have been moved to one of the cotteges across the railroad from the works. The company shipped 10 silver bricks from the works Wednesday that were valued at $15,000. The average fineness of the bricks was 9080. Mr. Roberts, for the company, has commenced the erection of concentrating works at Idaho. About 200 tons of ore per day are now being received at the works in Golden.

TWIN LAKES PLACER.—Leadville *Herald:* A statement of the conditions and past operations of the Twin Lakes Con. Placer M. Co. has been issued by Mr. T. F. Van Wagenen, manager. Work has now been suspended for the winter, but will be resumed in the spring. It seems that this is to be one of the large and permanent properties of this section of the country. The yield last season, counting all the ground from the grass roots to bedrock, was about 23 cents to the cubic yard. Only one-sixth was gravel, and the gravel yielded $1 00 to the cubic yard. The property of the company consists of 3,000 acres, nearly all of which has been already patented. For fluming and ditching, besides other improvements, the sum of $7,385 has been expended and nearly $5,000 paid out for surveying and procuring patents. There is territory sufficient to last for many years.

IDAHO.

BUSINESS AT BULLION.—Wood River *Miner*, Dec. 17: Notwithstanding that midwinter is almost upon us, business booms right along in and about Bullion camp. The following mines are being worked and are piling up great heaps of high grade ore on the dumps: The Bullion, Mayflower, Eureka, Idahoan, Homestake, Jay Gould, O. K., Red Elephent, Durango end Mountain View. By the time the snows of winter have disappeared and the earth is covered with a rich, nutritious grass for the stock of incoming freighters there will be an emount of ore on the dumps of the mines of Bullion meny times in excess of what has been on hend any time this year.

NEW STRIKE IN THE IDAHOAN.—News was brought in Thursday night of a new strike in the upper tunnel of the Idehoan, and yesterday several citizens went up to Bullion to ascertain particulars in regard to it. They reported the discovery of an apparently large ledge in the upper tunnel and a little over 200 ft from the entrance. Specimens of the ore brought in show it to be a fine grede of galena. The Eureka mine is on the same mountain opposite the Idahoan, and a number of prospects lately begun on this mountain show traces of mineral everywhere. There is little doubt but that the entire mountain, like that to the southwest of it in which the W. R. G. & S. M. Co.'s properties are located, is full of rich rock.

SOLD.—Wood River *Times*, Dec. 21: Prof. Jenney came in from Salt Lake last week to give directions to the miners at work on the Red Elephant and Durango groups of mines at Bullion, and left after remaining here two deys. From the City of Saints, Prof. Jenney will go to Arizona where he is called to testify in an important miuing suit, and will return here in a few weeks. The mines which Prof. Jenney came here to visit consist of two groups, one of which is situated at each end of the productive mines of Bullion. The Red Elephent group adjoins the O K mine on the northwest; it consists of five claims, all of which are expected to make a good showing in the spring. In the Red Elephant there is already a vein carrying 27 inches of solid galena in sight, and widening depth. The depth attained at the time of the Prof.'s visit was 20 ft, the ore having improved from 80 ounces at the surface to 120 ounces at the bottom. The Durango group adjoins the Ophir on the south, and consists of six promising claims, some of which already give evidence of containing ore. The two groups above-mentioned were purchased about four weeks ago by Prof. Jenney, for R. C. Chambers, of Salt Lake. The price paid is said to have been ridiculously low—the figures stated being less than $15,000 for the claims.

ONTARIO.—Rook's group of mines on the west fork of Wood river (Warm Spring creek), continues to open up satisfactorily. About three weeks ago a big cave of ore was struck in the Ontario, which yielded 150 tons in two weeks, when, there being no room for any more on the dump, the work of extracting it ceased, with ore in sight in all parts of the cavo. The cave was thoroughly sampled, the samples being sent to Supt. Rooks in Salt Lake, where they were assayed. They went from 150 to 174 ounces in silver to the ton, besides 69% in lead. Major Rooks has gone to Boston to spend the winter, with the intention of returning early in the spring.

MONTANA.

THE MOULTON MILL STARTED.—*Inter-Mountain*, Dec. 17: After a short preliminary run last night, 20 of the stamps in the new Moulton mill were dropped on ore this morning. The mammoth engine is running smoothly and noiselessly, and all parts of the mill seem to be in perfect order. Some little adjustment of the stamps is necessary in order to get the proper "splash," and to do this successfully may require several days yet. The mill, however, may be considered fairly in operation, though an occasional stoppage of a few hours may be required before everything can be got in perfect running order. Although, as Mr. Clark states, sufficient ore could be extracted from the Moulton to keep 40 stamps in operation, it is not deemed wise to tax the productive capacity of the property until the levels are more fully opened. Mr. Clark is in favor of working the mine ahead of the mill, not of working every ton of ore as rapidly as it can be extracted. The starting up of the Moulton is an important event in this district.

THE BANNACK MINES SOLD.—*Inter-Mountain*, Dec. 21: A private letter from Bannack says that the sale of the Bannack and Marysville gold quartz lodes has been consummated through the agency of Messrs. Smith & Ostrom to a New York and London Co. These mines have been under bond for some time past and their sale has finally been effected. The mines embrace a group of gold mines located in that district that have yielded an immense amount of gold in the past. These mines have large bedies of low-grade free milling quartz in sight, while the base ores are of a high grade. The mines sold include the Dakota, Madamoiselle and Washington lodes on the north side and the Excelsior, French, Wadams and Bannack lodes on the south side of Crasshopper creek, for the sum of $125,000. The new company, it is understood, propose to erect a large mill for the free ores and will reduce the base ores by the smelting process.

UTAH.

SILVER REEF.—*Miner*, Dec. 17: The weekly visit of our mining reporter along the great silver lodes of the district found a state of cheering activity, at all the principal mines. The extensive ore dumps, which show no depletion from the constant drafts made upon them, are themselves a fair premise to drew conclusions from; but a trip into the subterranean chambers, and a survey of their treasure-laden walls, will justify all reasonable anticipation for the future.

THE BARBEE & WALKER.—The 3d and 4th levels north of this mine are both in high-grade ore, from the stopes, of which the principal mill supply is at present obtained. The judicious manner in which this mine is being worked reflects deserving credit on the management. The mill has had an uninterrupted run during the month, with a fair average product, which the bullion shipment will attest.

THE LEEDS.—An important strike has just been made on the 4th level north in the Jenneas shaft. This is more important as it demonstrates clearly the permanence of the ore bodies in the north workings of the mine. This rich body was encountered 120 ft north from the melt shaft, and at present shows a strong 6-ft vein in the face, with every indication of improvement. The Bonanza and Lemmon shafts continue to supply the mill with an abundance of ore for the stamps. An increased output of bullion is promised for the present month, which will no doubt be further enlarged when the higher grade ores from the Jenaens find their way to the battery.

THE CHRISTY CO.—The various mines of this company continue to be successfully developed, and new and important strikes are reported in several, notably, in the old and reliable Tecumseh. The Maggie keeps up its regular shipments, and is looking well throughout. Contractors on the east level of the Uncle Sam, from bottom of the vertical discovery shaft, have encountered ore of a much better grade than that heretofore found. Among the other properties upon which this company is at present prosecuting work is the Silver Point, Silver Crown, Hillside, Great Western and Northern Light, in all of which good milling ore is being raised in greater or less quantities.

THE STORMONT CO.—In the Buckeye new ground is being opened far in advance of the present requirements, and every precaution taken to provide substantial ore reserves. The extension of the 4th level south continues in the same excellent grade of ore that was reported previously, and is fast nearing the locality—at some 300 ft greater depth—which contained the rich bonanzas that made the Last Chance famous. This ground can be far more economically worked through the main Buckeye shaft than from the old incline of the chance, the machinery of which was inadequate for greater depth.

OTHER PROPERTIES.—Among the numerous claims now receiving attention, and which will come in prominence at an early day, we note the McKelvy, Emily Jane, Gisboro, McMullen, Vanderhilt, Grey Eagle, Mayflower, Romulus, Last Chance, Susan, James Duffin, Toquerville, Bisacker & Gibfried, and others on the east apexes of the Buckeye and White Reefs.

GOLD BASIN.—A recent shipment of 50 lbs. of gold amalgam, valued at $5,000, is reported from the Patterson & Ridenour mill at that place, and everything is represented as being in a prosperous condition.

GRAND GULCH AND COPPER MOUNTAIN.—Active operations continue at these localities, and the shipment of copper ingots occur weekly. Copper is destined to become one of the great industries of southern Utah in the near future, and is now beginning to receive its share of attention.

EL DORADO CANYON.—Favorable reports are received from this district. A syndicate, composed of several of our solid business men, has just procured a lease of the Lincoln Co.'s mill, and will start it up on ores from their property. Mr. James Cronen is resident manager, and is making a success of the enterprise.

Meetings and Elections.

Ophir M. Co., Dec. Trustees—C. L. Weller (President), A. K. P. Harmon (Vice-President), C. H. Fish, J. H. Dohiuson, C. O'Connor, R. H. Follis and George Congdon. C. L. McCoy was re-elected Secretary and W. H. Patton Supt. The bullion product of the mine for the year past was $49,527.18. Of this amount $41 353.39 came from ore taken from the croppings, which evereged $24.36 per ton, the yield being 69½% of the essay value, no allowance being made for moisture.

Guterio M. Co., Dec. 24. Trustees—J. B. Haggin, President; Jos. Clark, Vice-President; Louis T. Haggin, William Willis, J. C. Ball and W. B. Carr, of this city, and R. P. Lounsberg, of New York; Secretary, J. K. Goodrich; Supt. R. C. Chambers; Assistant Secretary and Transfer Agent in New York, H. E. Parsons.

Presidio Railroad. Trustees—A. S. Hallidie, Albert Miller, A. W. Bowman, James Moffitt, Robert Watt, J. G. Kittle, N. J. Brittain.

THE MINING AND SCIENTIFIC PRESS of the 17th inst. is a double number, devoted chiefly to Arizona and New Mexico.—*Pinal Drill.*

A Representative Gold Mine.

Report of the Idaho mine, Nevada county, for the year:

The fifteenth annual meeting of the Idaho mining company was held on the 19th inst., at which the following official reports were received, read and approved.

To the Stockholders of the Idaho Quartz Mining Company—GENTLEMEN: I herewith submit for your consideration my annual report for the year ending December 5th, 1881. During the year now past the business of the company has progressed in a satisfactory manner. The work connected with the company's property has also been kept in as favorable a condition as circumstances would permit; and it is considered that there is fully as much pay ore in sight underground now as there was one year ago; and as was expected the yield has been more satisfactory than it was last year. This also has brought an increase of profits, which have been disbursed to the stockholders by increased monthly dividends.

In several of my reports I have stated that our machinery was of adequate power to do all the work required, but each year seems to require an addition, and while we may congratulate ourselves on the apparent permanenoy of the mine, we should also bear in mind that as we attain greater depth, it brings with it the need of larger and heavier machinery. We have hsen troubled considerably in the past to adjust the pumps for both winter and summer use. In the winter the surface water is very fast, requiring 14-inch pumps to keep it at about eight strokes per minute. This water is caught at the 800-level, and below that point a six-inch pump will answer at any time in the year. In the summer months the 14-inch pumps are too large, and have to be run so slow that the six-inch are too small to do the reqnired work below the 800-level, and in view of this difficulty, and inorder to do away with some of the flat rods it was deemed advisable to erect another engine to connect with the lower pumps and have them entirely independent of the large pumps. This engine is of 20 inch diameter and 48-inch stroke, and all its parts are of sufficient strength to work the engine up to its full capacity. As it is impossible to form an idea of the work this engine may have to do in the future, it was deemed best to make a good job in every particular, and when completed it will he second to none on the coast.

The sump at the 800 station has been enlarged. This was necessary from the fact that if from any cause the large pumps were stopped only a short time, the water ran to the bottom of the mine, and with 6-inch pumps ruuning so slow it required a loug time to pump it out. The sump is now 16 ft. by 14 ft. and 60 ft. long.

The underground workings are all in good condition. The 1100 drift is in 850 ft from the incline. The ledge has been of an average quality and size until recently. It now shows indications of breaking up, and I fear we have about exhausted the pay chute in this drift. The stopes connected with this drift are of good size and of an average quality.

The 1200 level is in 512 ft. from the incline. The ore in the drift is of low-grade all the way from the incline, and it has been broken up badly for the last 100 ft. I think, however, it is only local and that it will form again only a little below the bottom of the drift. It certainly extends only a short distance up, and the ore is of good quality and the ledge of good size all through the 1200 stopes.

The 1300 drift is in 124 ft. from the incline. As we wish to make a connection with the 1200 as soon as possihle, we have not taken the ledge down in this drift. We are now putting up a raise to the 1200, which will be through in ahout three weaks.

Preparations are now being made to commence sinking the incline for the 1400 level. In the last 100 ft. of sinking, the incline ran into the hanging wall. This made it quite expensive, and it is now thought hest to make a turn toward the footwall, and thus avoid working in the hard hanging wall rock.

During the year we have crushed 27,945 tons of rock. Of this amount 346½ tons came from the 1000 level and stopes; 9 753½ from the 1100; 15,527½ from the 1200; 1,977¾ from the 800, and 340 tons from the incline.

This gave a total yield of—

35,868 ozs. of bullion, value	$627,738.32
42 t ns of sulphurets	3,924.70
Tailings, worked on share	4,569.66
88 tons slime sold	4,569.66
Cost of working	1,584.00
Specimens	152.05
Total	$642,538.84

Yielding an average of $22.95⅞ per ton. Aversge cost of mining and milling per ton $9.51 1-9.

[The detailed statements of expenditures are summarized, but the aggregates will be found under the head of recapitulation.]

RECAPITULATION.

Mill and mining	$265,863.70
Saving sulphurets	2,042.50
Grinding tailings	1,378.07
Sinking incline	13,317.00
Sinking sump at 800 level	2,197.45
Air shaft	337.34
Opening bob pit in main incline	1,413.45
Retimbering main incline	420.94
V Flume	649.10
New engine at 1000 level	2,821.61
Repairs on brick pump house	1,980.34
New pumping engine	24,574.80
General account	19,356.08
Total	$336,368.41

Respectfully submitted,
EDWARD COLE, Supt.

Secretary's Report.

To the President and Stockholders of the Idaho Quartz Mining Company—GENTLEMEN:—The undersigned, Secretary of the above named company, in accordance with law and the by-laws of the company, submits for your consideration and action the fifteenth annual report of the oompany for the fiscal year ending Dec. 5th, 1881. At the commencement of the year just closed, there was in the treasury a casb balance of $29,262.29. By reference to the books of the company the several monthly reports of the superintendent, sustained by proper vouchers duly examined at each stated meeting of the Board of Trustees, the monthly receipts of the company from all sources for the year 1881, ending Dec. 5th, are as follows:

Dec., 1880	$10,270.62
Jan., 1881	66,951.39
Feb. "	52,018.39
Mar. "	52,271.13
Apr. "	51,390.54
May "	58,875.77
June "	56,655.47
July "	42,411.51
Aug. "	53,499.52
Sept. "	47,744.16
Oct. "	68,295.36
Nov. "	49,723.72
Total	$640,107.58
Cash on hand Dec 6, 1880	29,262.29
Assets for the year	$669,369.87

The monthly expenditures of the company for the period above, for all purposes amounted as follows:

Dec.	1880, including Dividend	137	$ 43,742 83
Jan.	1881, " "	138	48,804.77
Feb.	" " "	139	43,221.00
March	" " "	140	44,126.14
April	" " "	141	48,817.88
May	" " "	142	52,043.42
June	" " "	143	50,779.19
July	" " "	144	48,445.52
August	" " "	145	51,743 65
Sept.	" " "	446	54,236.23
Oct.	" " "	147	59,758.36
Nov.	" " "	148	61,834 40
Total			$607,018.41
Assets brought forward			569,360.87
Balance in Treasury Dec. 5, 1881			$ 61,751.46

To the foregoing monthly expenditures are included twelve dividends, declared by the Board of Trustees for the year herein stated, and at the time and amounts as follows:

Div. No.	Declared 1881	Per ct.	Amount.
137	Jan. 3,	5	$15,500
138	Feb. 7,	7½	23,250
139	Mar. 7,	7½	23,250
140	April 4,	7½	23,250
141	May 2,	7½	23,250
142	June 6,	7½	23,250
143	July 4,	7½	23,250
144	Aug. 1,	7½	23,250
145	Sept. 5,	7½	23,250
146	Oct. 8,	7½	23,250
147	Nov. 7,	7½	23,250
148	Dec. 5,	7½	23,250

Being for the year 12 dividends, paying 87½% and amounting to $271,250. The undersigned respeotfully refers the President and stockholders to the 15th annual report of the snperintendent of the mine and to the report of the Treasurer for detailed statements of the foregoing several summaries, and which are made a part of this report. Bafore closing this branch of the subject the Secretary deems it not inappropriate to present in epitomised form the aggregate receipts and expenditures of the company for the last thirteen years, that heing the time in which the mine has paid dividends, and before which only prospecting was done.

Receipts from all sources in the years:

1869	$ 306,038.75
1870	183,450.23
1871	407,301.16
1872	404,035.52
1873	1,010,612.20
1874	669,023.03
1875	509,430.72
1876	573,923.31
1877	525,435.18
1878	609,449.18
1879	501,033.15
1880	440,445.59
1881	640,107.58
Total receipts for 13 years	$6,780,295.60

There has been paid out in dividends to the stockholders as follows:

Year.	Dividend.	Per cent.	Amount.
1869	11	55½	$170,500
1870	7	12	37,200
1871	12	75	232,500
1872	11	52½	162,750
1873	12	220	682,000
1874	12	102½	317,750
1875	11	55½	172,050
1876	12	82½	255,750
1877	12	77½	240,250
1878	12	85	263,500
1879	12	54½	168,950
1880	12	41	127,100
1881	12	87½	271,250

Being for thirteen years 148 dividends and paying 1,000⅛%, amounting to $3,101,550.

The Secretary submits for the examinatiou of all stockholders all books and papers connected with this office. All of which is respectfully submitted. GEO. W. HILL, Secretary.

I. Q. M. Co.

To Edward Coleman, President.

Treasurer's Report.

To the President and Stockholders of the Idaho Quartz Mining Co.—GENTLEMEN: I herewith submit my annual report as Treasurer of said Co., for the year ending Dec. 5, 1881:

RECEIPTS.

By cash on hand Dec. 6, 1880	$ 29,262.20
Receipts from 35,868 ounces of bullion	627,738.32
Sulphurets	3,924.70
Sale of specimens	152.50
Percentage from tailings and slime	6,253.13
Pan rent	1,378.00
Sundries	660.03
Total receipts	$669,369.87

DISBURSEMENTS.

Paid Supt's. checks	$336,368.41
Paid 12 dividends	271,250.00
Total	$608,618.41
Balance cash on hand	$ 61,751.46

Respectfully submitted,
JOHN C. COLEMAN, Treasurer.

Treatment of Sulphurets.

From a letter in the London *Mining Journal* we take the following extracts:

In continuation of my letter I would observe before entering on the subject of the treatment of the pyrites which fills a considerable space in Mr. Lock's paper on the Causes of Success and Failnre in Gold Mining, read at the Society of Arts, it will be as well to examine the properties of mercury and the causes of its inefficiency—sickening, flouring, frothing up—when in contact with auro-pyrites. No assistance in this respect is derived from the paper nor from the discussion thereon, the impression being left that mercury mnst be taken with all faults, no substitute being possible. There is a law of chemistry, that simple substances only combine with simple snbstances, and compound only with compound substances. Free gold, metallic gold, a simple substance combines with mercury a simple substance. Mineralized gold, that is gold in combination with sulphnr, a compound substance, does not combine with mercury. It is popularly believed that gold exists in the metallic state only while chemistry recognizes several compounds of gold with other elementary substances, including aurous sulphide, Au_2S, and anrio sulphids, Au_2S_3. These sulphides of gold in association with sulphide of iron are the auro-pyrites found with the free gold. The metal mercnry also combines with sulphnr. Two sulpbides are known, mercurous oxide, Hg_2O, and mercurio oxide, HgO; the lattor is cinnibar, the mineral whence the metal mercury is obtained by sublimation. Mercury, gold and iron it will be seen have all an affinity for sulphur, and when the auro-pyrites, compounds of gold and iron with sulphur are in contact with the mercury, the affinity of that metal for the sulphur leads to a contest for its possession, and a disturbance ensues, the mercury sickening, flouring, frothing up causing a loss of both mercury and gold.

The treatment of the pyritos left with the tailings after extracting the free or metallic gold by amalgamation with mercury is the vexed question puzzling gold miners, and which all their knowledge is insnfficient to surmount. Every miner knows that roasting does not set free the gold in the pyrites and is anxious to know what will. The roasted mineral is never completely desulphurized, in the best cases enough sulphur remaining with the iron and the gold to prevent amalgamation with mercury. The agencies with which nature has operated to eliminate free or metallic gold from its asssociates, sulphur and iron, are heat, moisture, atmospheric air, and time. In the roasting process heat and air are present, moisture and time absent. The operations of nature have been protracted through long periods of time in remote ages, while the duration of the furnace roasting occupies 12 or at most 18 honrs.

The popular belief that gold exists only in the metallic form, native gold or free gold, has a compauion belief that gold unites with no other substance than mercury. Mr. Lock, under the bead "Occurrence of Gold" and "Treatment of the Pyrites," actually adopts the first, and by omitting mention of any substitute for mercury by implication adopts the second. The first having been disposed of the second remains to be considered. Mercury as a metal fluid at ordinary temperatnres presents a rough and ready method available in remote regions—where gold mines are for the most part situated—for the collection of free gold. In this case simple substances only are in question. Gold combines with other metals, which though solid at ordinary temperatures are fluid in a state of fusion. It is of every day occurrence that mineralized gold a compound is in the furnace brought into contact with mineralized copper, also a compound substance. Desulphurization takes place, the iron in association with the gold and the iron in association with the copper are slagged off, the gold remaining in association with the copper as a regnlus. This is commonly practiced in South America where ores rich in copper, gold and silver are found, the regulus finding its way to Swansea, where the copper, gold and silver contents are brought to the metallio form by the Ziervogel and Augustin processes, and thus in the present actually on the grand scale may he seen Mr. Lock'sspeculations on the fnture of gold mining. "Having" he says "secured the pyrites in a fairly clean condition the next etep is to extract the gold contained in them. This is often conducted as a separate branch of industry, especially where the proportion of pyrites yielded by the ores is too small to permit of each mine maintaining an establishment for the purpose, and where the necessary facilities, cheap fuel and skilled labor, do not exist."

"Securing the pyrites in a fairly clean condition" evidently means their concentration into a smaller hulk, the removal by mechanical means of the quartz or other matrix before shipment from the mine. This is correct as far as it goes, but it does not go far enough if the old practice of sluicing by water down inclined planes to catch the gold in mercnry tronghs and the pyritea on blankets are to be retained. The proposition so interpreted means two concentrating operations where one would suffice. It is hard to break with old habits or ideas. Mr. Lock does so gently, apeaka only of the concentration of pyrites, or what is termed the blanket aands, an entering wedge which will succeed by the holder plan of concentrating the whole mass of mineral as it comea from the stamps and collecting the free gold at the same time as the auro-pyrites, leaving but a small bulk remaining for combination with either mercury or copper. In the same discreet way Mr. Lock has introduced the substitution of air in the place of water as a medium of separation. Other projected improvements are from time to time brought forward. Mr. Hay Anderson proposes to supersede both etamps and water, and to adopt in their places Mr. Readwin's system of dry grinding in pans, with marcury medicated to prevent sickening. It is to be feared that grinding in pans proceeds at a speed too slow to satisfy the desires of shareholders for dividends. Supposing that an antidote will cure the mercnry of its disease, stamping a more rapid method of comminution than grinding, with preliminary concentration to reduce the bnlk to be subsequently ground, would remove an important objection. A French chemist proposes to use calomel, a compound of mercury with chlorine, Hg_2Cl_2, instead of the metal itself.

The more the subject is considered the more evident it will appear that it is indispensable to draw a broad line of distinction bstween mines supplying only the precious metal free gold, and mines yielding auro-pyrites only, or auro-pyrites mixed with free gold. The first only are suited to the rough and ready process of amalgamation with mercury. For the second class—termed base ores—ohcap fuel and skilled labor are primary necessities, as the gold thsy contain can only be extracted by chemical treatment in the furnace. To which olass the Indian mines belong the explorations now in progress will decide. Some reports recently published mention the presence of iron, regarding it as a hopeful sign of gold. It is quite probable that such mines with proper treatment may prove—of the two classes—the more profitable.

Timber Reservations.

Bills have been introduced in Congress setting aside as reservations for public parks certain groves of big trees (*Sequoia gigantea*) in this State, which in the main is a good thing. An old subscriber of the PRESS calls our attention, however, to the fact that there are two sides to the question of this reservation bnsiness. He has a somewhat different view from the general one, and as it is well to consider both sides, and be sure of being right before going ahead, his opinion is given publicity.

One bill introduced is to crsate a reservation on a very large tract of *Sequoia*, in Tulare, where, our informant says, that although the trees are large, there are only two noted ones. These are the General Grant and Hugh Miller, and they stand in the body of a large tract of timber, though they are some seven or eight miles apart.

Very few stop to consider that by reserving this large tract considerahle money is kept out of circulation. It contains upwards of 15,000 acres of timber, with perhaps 300,000,000 ft. of timber, of which probably 50,000,000 ft. are redwood, or *Sequoia*. It is bard to tell where one kind of tree leaves off and the other begins.

The tract lies on the south side of King's river, and has been so far untouched, becanse it was impossible to haul out or get at in any ordinary way. It will reqnire some $200,000 to utilize the tract, so that cutting and marketing would he of benefit to some persons, of course. Some capitalists had just made arrangements to utilize this tract, and were prepared to spend the above amonnt of money. The land, as it stands, is represented to be utterly worthless for any small operation, and can never be touched unless done cheaply on a large scale. Of course, as soon as the hill was introduced, the capitalists stopped work.

The gentleman to whom we refer, told ns, in answer to a question, that the damage around Lake Tahoe had been exaggerated. Some of the logs have been cnt off, but a very large proportion was still left around the shores. This was cnt for timber, not wood. It is only since they have commenced to cut down trees for wood. He thinks about one acre out of every 5,000 has been cut off the shores of Lake Tahoe, no more. It would be more sensible to create a reservation around the lake than in Tulare connty.

We present these opinions as those of persons who take a utilitarian view of the ordinary timber reservations. They do not think it just to reserve large tracts because a few noted trees exist there; and think that making timber is much better for the country than making timber reservations.

A NEW TORPEDO.—Trajan Theodoresco, a Roumanian engineer, is said to have recently invented a new torpedo, or submarine boat, the peculiarity of which is that it is capable of maneuvering under water 12 hours at a time. It is ahle to act at depths of from 100 ft. in rivers to 700 ft. or 800 ft. in the sea. Through the agency of screws it may be made to sink or rise noislessly, and either euddenly or gradually by snccessive stages, and can move or maneuver in any direction. The illumination of the vessel is internal and enables the officers upon her to see for a distance of 130 ft. under water.

In order to secnre the right of possession to a mining claim there must be compliance not only with the laws of the United States, but also with such *local* regulations of the mining district as are not in conflict therewith.

A Debris Compromise.

EDITORS PRESS:—Your correspondent in the PRESS of Dec. 17th, on a "debris compromise," and "proposed re-working of river beds," has advanced some good ideas, but are they feasible? In my judgment they are not, for want of sufficient fall in the rivers where the tailings are deposited. The best evidence of this is that in early years of California mining the debris commenced to lodge in the river channels, and the deposition has increased just in proportion to the increase of drift and hydraulic mining. I include drift mines because there are many such mines in the State that move and wash more ground in a year than one-third of the hydraulic mines.

Your correspondent, M. T., says "all these streams have a heavy fall or grade in the mountain region." I might here ask M. T. what he considers a heavy fall for sluice grade? There are, perhaps, more mines worked with six inches' fall to 12 ft., than any other grade, —220 ft. per mile. Very few flumes in hydraulic mines work at three inches to 12 ft. Even this grade would require 110 ft. per mile. Bear river originally had a fall of less than 70 ft. per mile for 20 miles, from the mining dump down. A flume on a grade of one inch and a half to 12 ft. would require about 55 ft. per mile. Does Mr. T. believe the tailings can be successfully handled on this grade? He must remember that in the first washing the loam, clays and lighter rocks passed on down, leaving the heavy quartz rocks, gravel and sand in the river beds. If there was sufficient fall to the rivers, the tailings would long since have been worked and dumped into outside basins.

The Yuba river at Smartsville originally had 22 ft. fall per mile, and at San Juan 34 ft. per mile. From these points up the fall increases rapidly. I mention these two points because they are very extensive mining districts. It seems to me utterly impossible to move the tailings to bedrock that are deposited in either of these rivers. The American and Feather rivers are subject to the same general laws.

I have for many years held that the only sure and safe way to control the debris from the mines will be to levee the rivers, condemn and pay for certain lands between the Yuba and Bear rivers, and between the latter river and the American, let the lands be built up by the overflow from waste weirs in the levees. A levee along the east bank of the Feather and Sacramento rivers, and also on north bank of the American river from month to high land, say sluice levees should be as high as the average high water mark, this would hold the water and settle it so that when it escaped through waste weirs to the river, it would be very free from matter.

Can this be done? Why not? Let the General Government come to the front and aid the State; let the State, by law, appoint a commission to survey, appraise at a fair valuation, the land required; pay for these lands; it will work; no hardship for a man to sell his farm at a fair price.

When these lands are filled up to, say, high water mark, the Feather and Sacramento rivers can be flumed and the slickens carried across and dumped in the tule for an indefinite period.

There has been one-third money enough expended in litigation and extravagant expenditures on levees and dams to accomplish what I propose. This done all will be happy, and the production of $20,000,000 gold annually will continue.

Now, Mr. Editor, I ask in all candor, will not the General Government aid in this matter? Say it does cost $1,000,000 or $2,000,000; are not the mining and agricultural interests of California of sufficient importance to demand this relief? Most certainly.

Suppose the miners finally gain their point and are allowed to mine without let or hindrance. It ought not to affect my proposition, for under it, all matter carried in suspension would be settled within the ponds and tule, and the water would go comparatively clear to the ocean.

A. F. W.

Oakland, Dec. 19, 1881.

THE student who aims to become something more than a learner—namely a doer, possibly a creator—must never allow himself to think that the possibilities of any fact or phenomenon have been exhausted—so far, we mean, as its utilization is concerned. The habit of inventing, in other words, seeking novel and useful applications for the knowledge gained, should go hand in hand with acquisition. The apparent progress will not be so rapid perhaps as by the method of "cramming," but it will be real and not liable to backsliding, while the possible profit of it will be incomparably greater.

DANIEL HALE HASKELL, in early days the head of the banking firm of Adams & Co., died at the Alms House last Saturday evening, at the age of 65 years. After the dissolution of the banking firm Adams became addicted to drink. He was, on Friday last, arrested for begging, and on the day following was sent by Judge Rix to the Alms House, where he died about 5 o'clock in the evening, shortly after his arrival.

EVERYTHING promises a brisk mining season in Shasta and Trinity.

Useful Information.

THE FASCINATION OF BIRDS BY SNAKES.—Catherine C. Hopely suggests in *Land and Water* a new theory of the so called fascination of birds by snakes. It is that the bird mistakes the snake's tongue, which the animal keeps in constant motion, while it otherwise remains perfectly still, for a lively worm, and gazes at it with the expectation of making food of it. The idea was suggested by observations at the Zoological gardens, where the birds where frequently seen watching the tongues of the snakes. Commenting upon the above the *Germantown Telegraph* says: This, we think, is a mistake. Judge Miller, of Missouri, told us a month or so ago that he had two plants of fine lettuce of which he desired to preserve the seed; but as the seed matured the goldfinches preyed upon them to such an extent as likely to rob him of all his prized seed. So, to preserve what there was left, he constructed an artificial snake of some striped stuff, filled it with bran, curled it up and placed it near the stalks, where the birds could see it plainly; and the result was that not a bird approached the plant.

A HEAT CONSERVATOR.—An important and useful invention is a method for keeping coffee, tea, chocolate and other kinds of drinks and food hot from one to 20 hours, the quality of the articles preserved being unchanged. No artificial heat is used in the process, and its practicability was demonstrated Thanksgiving day by A. L. Moffit, of Boston. A 10-gallon tank of hot coffee was made at 6 A. M., and shipped to a hotel in the country, when it was served to the guests at 3 P. M.—hot; as if it had just come from the fire; at 10 P. M. the temperature was but little changed, and 28 hours after the coffee was made, it was still warm enough to form a pleasant drink. It was kept in a wooden tank, quite apart from any heating surface, the tank presumably lined or interlined with some extraordinary heat-conserving material.

OUR PACIFIC SEAL-SKIN INTEREST.—An abstract of the preliminary report of a special agent of the U. S. Census Bureau shows that the total seal skins and sea-otter skins taken on our Pacific coast during 1880 was about 160,000. Of sea-otter, having an average value of $50 per skin, there were 3,500 captured in Alaska and 75 in California. Of the fur seal there was a total of 155,000 taken, of which 147,000 were taken in Alaska, valued at $10 each; 6,000 in Washington Territory and 2,000 in California, valued at only $5 per skin. The total value in first hands is about $1,750,000. The total capital invested in the business, excepting Indian canoes and material, which no attempt was made to value, is about $750,000.

BROWN BRASS.—The following recipe is said to produce a good brown tone upon brass: The article, after having been thoroughly cleansed and freed of all traces of grease, then polished, is dipped for about half a minute into a cold solution of 10 grams of hypomanganate of potash, 50 grs. green vitriol, 5 grs. muriatic acid, and 1 liter water; then rinse well and dry in fine soft sawdust; if a reddish cast is desired, dip the article into a second bath heated to 60° C., of 10 grs. chromic acid, 10 grs. chloric acid, 10 grs. hypomanganate of potash, and 50 grs. blue vitriol (sulphate of copper) dissolved in 1 liter water. The latter mixture alone produces a light bronze. The article may afterward be heated in an oven, which operation, it is said, produces a very rich tone.

IMITATION GROUND GLASS.—A very useful kind of varnish is made known by Leon Vidal, which is excellent for producing imitation of ground glass, and will doubtless be found available for other purposes. The formula is: Sandarac, 18 parts; mastic, 4 parts; ether, 200 parts; benzol, 80 to 100 parts. It would be well if the ether in its composition could be replaced by some less expensive liquid, otherwise the cost of coating a large window would be rather considerable. Perhaps some one will be able to improve upon this formula. One great advantage of such a varnish is that it can be easily removed when no longer required to produce an opaque or semi-translucent window.

IMPROVED INDIA RUBBER.—A French inventor has recently patented a method of improving India rubber and gutta-percha by the addition of a distillate of birch bark. By distilling the outer layers of the bark he obtains a dense, black, gummy matter, which possesses the properties of ordinary gutta-percha, with the additional quality of resisting both the action of air and the strongest corrosive acids. He claims also that by adding a small proportion of the birch bark gum to gutta-percha or to India rubber (one-twentieth part will suffice), the durability of the rubber or the gutta-percha will be greatly increased, the new mixture not being acted upon by the air or by acids.

CASH BOYS are being superseded in a Boston store by a mechanical arrangement for conveying purchase money from the sales clerks to the cashier's desk, and returning the change. The device is essentially a duplex system of inclined grooves connecting the stations of the various clerks with the cashier's desk. The money is placed in hollow balls which readily traverse the inclined grooves back and forth by the force of gravity.

CHESTNUT FLOUR is made by drying, or, rather, roasting fresh chestnuts for three days and nights in a drying room, on a latticed floor covering a chamber in which a fire is lighted. The husk is then easily removable, and the kernel is ready to be ground into flour, which is of a pinkish color. This is mixed to the consistence of cream with water, and poured on fresh chestnut leaves to be baked into small circular cakes between heated stones. Chemical analysis shows it to contain 40% of nutritious matter soluble in pure water, and it ought to be easy of digestion and suitable for children's food.

CEMENT FOR GLASS.—To make a cement for glass that will resist acids, take 10½ lbs. of pulverized stone and glass, and mix with it 4½ lbs. of sulphur. Subject the mixture to such a degree of heat that the sulphur melts. Stir until the whole becomes homogeneous, and then run into molds. When required for use it is to be heated to 248°, at which temperature it melts, and may be employed in the usual manner. It resists the action of acids, never changes in the air and is not affected in boiling water. At 230° it is said to be as hard as stone.

COLORING GLASS.—Colors are usually imparted to glass in the melting pot; for blue, oxide of cobalt is used; for red or gold, suboxide of copper. Glass is stained by painting its surface with a fusible-colored glass ground to a fine powder and mixed up with gum water or turpentine, and, after trying, then heating the painted glass in a furnace until the coating fuses. Collodion, shellac or spirit-copal varnishes, properly colored with one of the coal-tar dyes, can in some cases be advantageously employed as a colored wash for white glass.

"AMERICAN ARROWROOT" is not arrowroot at all, but simply potato starch. As *maranta arunainacea*, the source of true arrowroot, has been grown in some of the Southern States, "American arrowroot" is, possibly, an article of commerce, but if so, it is not sold under that name. What is bought and sold as American arrowroot is in no sense arrowroot at all, and yet, the consumers, at least, are led, by that name, to think that it is. Let the authorities start their experts to examine the article.

SOAP-BUBBLE BALLOONS.—Much amusement may be afforded by making soap-bubbles with ordinary gas conducted through a caoutchouc tube and clay pips to glycerine soap solution. A small disk of thin paper, with fine wire from its center to a little paper car with aeronaut figures may be connected to the bubble when it begins to swell. The disk being attached by capillarity to the part where the drop forms, the detached bubble rises with its car.

Good Health.

SWEET FLAG CANDY.—If what the *Country Gentleman* says of this in the following paragraph is correct, the roots of this plant may be really valuable: Sweet-flag candy is relished by all lovers of sweetmeats, and it is a valuable aid to digestion, as it will stop the disagreeable rising of gas, so annoying to dyspeptics. Being eaten greedily by children, it is often better than other medicine. A bit held in the mouth when one is caring for the sick will often counteract the effect of contagious germs. To prepare it, take fresh, healthy roots of sweet-flag, and after a careful washing, cut in slices one-eighth of an inch in thickness. Put them into a stewpan or bright basin, and pour a little more cold water over them than will cover them. Set on the stove and heat slowly; when the water boils turn it off. If the candy is desired for medicine, quite enough of the strength has been removed, but for a sweetmeat it is better if boiled up, and the water turned off four or five times. Now measure the sliced roots, and to each two cupfuls allow one and a half cupfuls of white sugar, turn on water enough to cover, return to the stove and simmer slowly, stirring often, until the water has quite boiled away; then turn out on buttered plates, and stir frequently until dry. The long simmering after the sugar is added makes the roots quite tender, and the candy will keep fresh and nice for years.

THE TREATMENT OF BURNS.—The London *Medical Record* says that Dr. J. Troizki, in a Russian medical journal, adds his testimony to that already published as to the value of solution of *bicarbonate of soda* as a dressing for burns. He says that during the previous year he noticed 25 cases of burns, mostly of a severe nature. Sixteen of them were received in a fire in a village, during a strong wind, when the inhabitants, in order to save their property, were obliged to work in the flames. In all these 25 cases bicarbonate of soda was exclusively applied. The result of this treatment was so favorable that the author considers himself justified in pronouncing this remedy the best and most efficient in burns of all kinds and degrees. Even in extensive burns of the second and third degrees, the pain was soon alleviated by the application of compresses soaked in a solution of bicarbonate of soda; and the wounds soon healed, leaving but few scars, and no impairment of the functions of the affected parts. No evil results from this extensive use of bicarbonate of soda, which might suggest the reception of carbonate acid into the blood, were noticed.

HOW VOLTAIRE CURED THE DECAY OF HIS STOMACH.—In the "Memoirs of Count Segur" there is the following anecdote: "My mother, the Countess de Segur, being asked by Voltaire respecting her health, told him that the most painful feeling she had arose from the decay in her stomach, and the difficulty of finding any kind of aliment that it could bear. Voltaire, by way of consolation, assured her that he was once for nearly a year in the same state, and believed to be incurable, but that, nevertheless, a very simple remedy had restored him. It consisted in taking no other nourishment than yolks of eggs beaten up with the flour of potatoes and water." Though this circumstance concerned so extraordinary a person as Voltaire, it is astonishing how little it is known and how rarely the remedy has been practiced. Its efficacy, however, in cases of debility, cannot be questioned, and the following is the mode of preparing this valuable article of food as recommended by Sir John Sinclair: Beat up an egg in a bowl and then add six tablespoonfuls of cold water, mixing the whole well together; then add two tablespoonfuls of farina of potatoes; let it be mixed thoroughly with the liquid in the bowl; then pour in as much boiling water as will convert the whole into a jelly, and mix it well. It may be taken alone or with the addition of a little milk in case of stomachic debility or consumptive disorders.

PEOPLE sleep with their mouth open, and thus make this organ perform a duty which should be performed by the nose. There are many objections to this. The air in passing through the channels of the nose, for instance, is raised to the temperature of the body before it reaches the larnyx. Thus breathing, no matter how low the temperature may be, the sense of cold is never felt below the border of the soft palate. But when one breathes through the mouth on a cold day the sensation proceeds as far as the larnyx, and an irritating cough may be caused. Then, again, in nose-breathing the air is moistened by the natural secretions which cover the turbinated bones in a condition of health, and the short, bristly hairs at the opening of the nostrils act as a filter to arrest impurities and reduce the likelihood of laryngial, bronchial or pulmonary disease. Infants, athletes, savages and animals breathe through the nose; the ordinary civilized man employs the mouth to an unnecessary, and often to a very injurious, extent.—*Journal of Health.*

NEAR-SIGHTEDNESS.—Persons living in cities begin to wear glasses earlier than country people, from the want of opportunities of looking at things at a distance. Those who wish to put far off the evil days of "spectacles" should accustom themselves to long views. The eye is always relieved and sees better if, after reading a while, we direct the sight to some far-distant object, even for a minute. Great travelers and hunters are seldom near-sighted. Sailors discern objects at a great distance with considerable distinctness, when a common eye sees nothing at all. One is reported to have such an acute sight, that he could tell when he was going to see an object. On one occasion, when the ship was in a sinking condition, and all were exceedingly anxious for a sight of land, he reported from the look-out that he could not exactly see the shore, but he could pretty near do it.—*Journal of Health.*

VACCINATION APPROVED.—It is singular that any well-informed person should entertain a doubt as to the efficacy of vaccination in the prevention of smallpox, yet there is considerable incredulity on the subject. The St. Louis Board of Health reflected for some time on this head, but finally decided in favor of vaccination. One firm basis for its belief, it is stated, was drawn from the fact that "not a death from smallpox has occurred in that city for five years, during which period vaccination has been more generally practiced than, perhaps, in any other large city in the country." Those communities which neglect vaccination, generally have a sad experience to convince them of their error.

TOBACCO AND COLOR BLINDNESS.—A Belgian physician has ascertained, during a tour of observation and inquiry made at the request of the government authorities, that the very general use of tobacco is the main cause of color blindness; and this affection is now occasioning no slight anxiety both in Belgium and Germany from its influence on railway accidents, and also from the military point of view. It is not surprising, therefore, that these facts have led to the issuing of orders in certain towns of Germany, forbidding all lads under 16 years of age from smoking in the streets.

COMFORT FOR GUM CHEWERS.—The spruce gum industry of Maine is represented to be in a highly flourishing condition. Men who range the woods collecting the gum make good wages, selling the article for 40 cts. a pound. Altogether, residents of the State obtain $40,000 yearly by the sale of the article. Inquiry concerning its use discloses the interesting fact that it is sold chiefly to factory girls. A further investigation regarding the dangers of lockjaw and paralysis of the tongue in noisy factories, and the use of chewing gum as a preventative, is now suggested.

THERE were severe gales and heavy rains throughout England, on Saturday and Sunday, many houses being unroofed and partly demolished, rivers overflowed and trees prostrated,

SAN FRANCISCO:
Saturday Morning, Dec. 31, 1881

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Spring Valley Hydraulic Gold Mine, 441. The Week; Close of the Volume; The Congressional Mining Committees; Re-locating Claims on Sunday, Foundry Notes; Re-location of Mining Claims, 448. Notices of Recent Patents, 449.

ILLUSTRATIONS.—Spring Valley Hydraulic Gold Mining Co.'s New Tunnel, 441.

CORRESPONDENCE.—The Hydraulic Mining Question; Sawtooth Mines, 442. A Debris Compromise, 447.

MECHANICAL PROGRESS.—Drilling Machines Operated by Electricity; Glass Roofing and Siding; Tinkering; An Elastic Lacquer; How Electric Wires are Covered; Rapid Melting of Iron, 443.

SCIENTIFIC PROGRESS.—Some Facts About Comets; Phosphorescent Alumina; Engraving by Electricity; Evidences of a Lunar Atmosphere; A Plan for Producing Rain, 443.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meeting and Dividends, 444.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana and Utah, 444-5

NEWS IN BRIEF on page 452, and other pages.

USEFUL INFORMATION.—The Fascination of Birds by Snakes; A Heat Conservator; Our Pacific Seal Skin Interest; Brown Glass, 447.

GOOD HEALTH.—Sweet Flag Candy; The Treatment of Burns; How Voltaire Cured the Decay of His Stomach; Near-Sightedness, 447.

MISCELLANEOUS.—A Representative Gold Mine; Treatment of Sulphurets; Timber Reservations, 446. Deep Mining, 452.

Business Announcements.

Mining Machinery, Reynolds & Rix, San Francisco.
Mining Supplies, Fraser & Chalmers, Chicago, Ill.
Tubbs Hotel, Sheldon I. Kellogg, Jr., Prop'r, Oakland.
Huntington's Osc llating Stamp Mill, F. A. Huntington.
Dividend Notice—German Savings and Loan Society.

Passing Events.

With this number of the MINING AND SCIENTIFIC PRESS we conclude Volume XLIII., a "passing event" of which our readers are asked to take special note, as it is a very proper time to renew subscriptions. We refer more fully to it, however, in another column.

The Gold Run case at Sacramento still moves on slowly, taking testimony not having yet been concluded. The testimony is very voluminous and much of it contradictory; but few people interested in "debris" can speak of the subject without difference of opinion. People looking at the same subject from different standpoints naturally reach different conclusions.

Attention is called to an interesting letter on the second page of this number, which gives some valuable facts concerning the debris question in Placer county. Our readers are also requested to note that there is considerable original correspondence in this number of the PRESS, all of which is worthy of careful perusal.

The copious index on the last page shows what a wide range of subjects has been treated in the volume. Our readers will do well to file the PRESS, since, with the index, it forms a reference on mining and metallurgical matters nowhere else to be found.

Our columns are so crowded this week that we omit the usual illustration from the ninth page.

To all our readers, A HAPPY NEW YEAR. May the sun of prosperity illumine your homes and warm your hearts. May the right and the true fill your minds, elevate your aspirations, and be the secret of your successes. May death pass you by; may disease be averted, and the circle of blessings, led in by the revolving months, be unbroken.

Close of the Volume.

This number is the final one of Volume XLIII of the MINING AND SCIENTIFIC PRESS, and we feel assured that our readers will acknowledge that the volume has contained a mass of information, on all topics, which has been both interesting and valuable to them.

The copious index, which fills the last page of this paper, is a sufficient indication of the scope and variety of the subjects treated during the past six months, to convince anyone of the trouble we have taken to collect miscellaneous, technical information of every kind.

It is hardly necessary for us to review the contents of the volume even in the abstract. The pages have spoken for themselves. We have endeavored to keep the PRESS abreast of the progressive times in which we move; and to keep for our readers a careful watch on all that could be useful or instructive to them. We have on several occasions given double numbers, containing special information; and propose in the future to do this even more frequently, as occasion offers.

We will begin the new volume with renewed energy and vigor, and a consciousness that as "times" are improving and mining fields widening, the PRESS will also improve and have larger and wider opportunities for gathering information of use to its special readers.

All that we ask is the kind co-operation and assistance of those to whose interests we are indebted, and we feel that both will be extended to us in the future as in the past.

The Congressional Mining Committees.

New York, world-renowned for the extent of its mining industry, in the distribution of favors gets the chairmanship of the House Committee of Mines and Mining. There is a special fitness in this, as it seems to be the prevailing policy to put people where they are not wanted, and where they will only have "not to do it." The chairmanship of the Committee on Commerce, which that State ought to have had, it did not get, and a growl arises, as she is not represented at all in said committee; but the chairmanship of the Committee on Commerce is given to Page, of California. Why the positions were not reversed, taking into consideration the interests of the respective States, it is hard for one not a politician to see.

The House Committee on Mines and Mining consists of Van Voorhees, of New York, Chairman; Brigham, Barry and Cassidy. Mr. Owry, of Arizona, a Territorial delegate, will take part in the deliberations of the committee, but cannot, of course, vote. No better man than Gen. Rosecrans could have been found to have put on this committee, as he is familiar with mines and mining interests of this coast, having worked practically at their development, and is, moreover, in sympathy with the working miners.

The Senate Mining Committee, for the first time in many years, is now controlled by Senators of practical experience. Still there are some there who know nothing and care nothing about mining. Hill, of Colorado, is Chairman; Miller, of this State; Fair, of Nevada; and Jones, of Nevada, are on the committee; Van Wyck, Hampton and Camden are the others. The debris bills which have been introduced, will, in all probability, go to the Commerce Committee, which has charge of the improvements of rivers and harbors. With Mr. Page on this committee, there may be something done about our harbor of refuge on this coast, and the improvement of our rivers will be more closely looked after. For a Californian to be chairman of so important a committee is somewhat novel; but perhaps the Government is finding that San Francisco has a commerce worth noticing.

Re-Locating Claims on Sunday.

The 1st of January will be on Sunday and some persons may think this being a legal holiday, will not be a day on which claims may be re-located legally. But Monday will also be a legal holiday, being the one on which New Year's day is celebrated. Without pretending to know more about it than others, the PRESS advises men to be on hand on the Sunday morning and then they will be on the safe side. The reason we advise this is that the Secretary of the Interior, in July, 1879, in a written opinion to the Commissioner of the General Land Office, took the ground that in the absence of a law to the contrary, an adverse claim may be filed on Sunday, or out of office hours, if the local officers are willing to receive it. He said: "While it is true that officers are not expected nor required to transact business out of office hours or on Sunday, still there is no law of the United States prohibiting them from doing such business. Nor am I able to find any law of the State of Nevada which prohibits the transaction of ordinary business on the Sabbath day."

By a parity of reasoning there seems nothing to prevent men locating or relocating claims on Sunday. Therefore it would be unwise to delay beginning the annual assessment work on mines until Tuesday the 3d because the 1st and 2nd of January were both legal holidays. The one who did begin work on that day (the 1st), would be the most likely to hold the claim. At least that is our opinion.

Foundry Notes.

At the Union Iron Works, in this city, in addition to considerable mining and miscellaneous work they are engaged on some marine machinery which merits attention. It consists of a compound surface condensing engine for the new Coos Bay propellor, for E. E. Dean & Co., now lying in Oakland creek. The initial cylinder is 20 inches in diameter and the expansion cylinder 38 inches; stroke 30 inches. The crank shaft of the engine is made in sections and built up. It is specially heavy and is made in nine separate pieces. It is 10 inches in diameter and the crank pins are 10 inches in diameter.

The valves are of the O'Neill patent and are worked by the O'Neill valve motion and cut-off. The cut-off is placed on each cylinder. This is an advantage where varying pressures are liable to be used. Were the pressure varies the cut-off can be varied to equalize pressure in each cylinder. The air pumps are 16 inches in diameter, 15-inch stroke; and there are three inch feed and bilge pumps. These are all worked from a beam connected to the low pressure cross heads. The thrust bearing is secured to a projection cast on the main bed plate and has also the usual bolts, etc.

The circulating pump is an independent rotary pump worked by vertical engines. The propeller is 10 ft. in diameter, 13½ ft. pitch. It has a 9-inch propeller shaft, brass lined, where it passes through the stern bearing. The boilers are four in number—5 ft. 6 inches in diameter, and 8 ft. 6 inches long, and with single flues 32 inches in diameter and 6 ft. long. These are placed fore and aft, and arranged in pairs, so that any pair or one boiler may be disconnected. Two superheaters, 5 ft. in diameter, 5 ft. high, each with four 16-inch flues, are provided. The superheaters are connected by a breeching, to which the stack is attached. This engine has been designed for strength and compactness, and is all made first-class in every respect. It is in every way a very creditable piece of work.

Among other things, the works are engaged on a new double pump hoist for the Bullion mine for lifting pump rods, etc., from the pump compartment. The cylinders are 16 inches in diameter, and 24-inch stroke. The engines are connected by crank shafts, 10 inches in diameter in center, 8½-inch bearings. The engines are of the ordinary plain slide valve link motion type; and the engine beds are extended out so as to carry a spur wheel shaft. This shaft is 14 inches in diameter in the center.

There is a single 34-inch pinion on the engine shaft, made with V teeth, 4½-inch pitch. The fly-wheel is 10 ft. diameter, arranged with brakes. The spur gear is 167 inches in diameter, 4½ inch pitch, and has V teeth. The reels are made for flat wire ropes, and are small—4 ft.; outside diameter, 16 ft. The arms are bolted to a central hub. It is intended for 6-inch rope. The reels are arranged with indicators running back to a convenient position for the engineer. The whole thing is so arranged that all parts are easily seen and managed by the engineer. It is intended only for raising and lowering pumps and pump rods and all work in the pump shaft; so it is to run somewhat slower than the ordinary hoists.

They are just starting on a pair of 12x36 double hoists for the South Wellington colliery. This is a link-motion outfit, an exact duplicate of that furnished to the same company about three years ago. The engines are connected by a seven-inch crank shaft. There are two winding drums for round rope, 6 ft. in diameter, 4 ft. wide, connected together and driven by spur gear 77½ inches in diameter, 3 inch pitch, 10 inch face. The single pinion on the engine shaft is 25¾ inches in diameter.

The reels are placed in front of the engine and the bearings for the same are bolted to the engine bed. The fly wheel on the engine shaft is fitted with strap brake and foot lever; the reels are also fitted with brakes. This is a substantial and not very expensive style of hoist for mines.

They are just starting a 20 stamp mill for the Lake Valley mine, Mexico, fitted with a 20x48 in. O'Neill cut-off engine, an exact duplicate of the one being built for the Idaho mine, and which we shall describe in detail shortly. With this engine go four 54x16 boilers. The 20 stamp mill is a wet crushing one for silver. There are 16 combination pans and 8 Boss' standard settlers, two agitators and clean up pan, retorts, etc. Another engine 14x48 is also being built for a quartz mill in Mexico.

THE *Silver State* learns that Emmons & Young shipped a carload of antimony ore from Lovelock, which was taken from their mine near that place. By assorting the ore it averaged 60% antimony. It is said they have, without doubt, the most extensive antimony mine on the coast. The mountain upon which this mine is located is said to be a mass of antimony.

Relocations of Mining Claims.

In the last number of the MINING AND SCIENTIFIC PRESS we summarized the laws and decisions relative to the annual expenditures required by the U. S. mining laws, in view of the fact that this was the last week of the year and that miners were apt to forget all the details. In this issue we do the same thing with reference to "relocations," because, on the 1st day of January many claims will be subject to location by reason of failure to perform the annual assessment work.

But before we begin speaking about relocation, it is as well to remind miners that if they located their claims during 1881, they need do no assessment work before Dec. 31, 1882, and that the said claim is not relocatable until Jan. 1, 1883. The reason of this is that the law specifies that the year in which assessment work is due begins on the 1st of Jan. after the date of location, and this work can be done *any time* during that year. If the claim was located any time in 1880 the work was due any time in 1881, and if not done this week the claim is relocatable on the 1st of January, 1882, *provided* you are not on the ground on that day doing the work. The law, after telling about the amount of work to be done, says: "Upon a failure to comply with the foregoing conditions of annual expenditure, the claim or mine upon which said failure occurred shall be open to relocation in the same manner as if no location of the same land had ever been made: *Provided*, that the original locators, their heirs or assigns or legal representatives have not resumed work upon the claim after failure and before such location."

There is no doubt that some people have relocated claims which are not relocatable, from a misconception of the law.

It is as well to remind miners that when they do their work they should record it. We gave in last week's PRESS the form for "Proof of Labor."

The following form is a notice of location as given in "Copp's Mining Laws:

Notice of Location.

Notice is hereby given that the undersigned, having complied with the requirements of Chapter Six of Title Thirty-two of the Revised Statutes of the United States, and the local customs, laws and regulations, has located ——linear feet on the ——lode [20 acres of placer mining ground], situated in ——Mining District, ——County, ——, and described as follows:

[*Describe the claim accurately (by courses and distances, if possible), with reference to some natural object or permanent monument, and mark the boundaries by suitable monuments; if a placer claim is located on surveyed land, describe the legal subdivision.*]

Discovered ——, 188—. —— ——, Locator.
Located ——, 188—.
Attest:
——
——
Recorded ——, 188—.

In locations of abandoned mines (relocations), the fact that it is such a location should be stated, and the affidavits of two or more respectable parties that such mine was abandoned and subject to relocation, should be recorded with the location notice.

Where the location is by agent, that fact should be stated after the name of the locator, thus: By Thomas Jones, agent (or attorney).

Record of location notices in the absence of a district recorder should be made with the proper recorder of deeds from the county wherein the claim is situated. It is advisable to have these notices attested by witnesses, for locators cannot be too careful about their evidence.

If you are going to relocate a claim of your own for any reason, as for more particular identification or description, use the form given above, but state, after the description, that it is a relocation, and, in addition, where the original location is recorded, in order that the title may revert back to the original discovery.

Work on a claim is work done anywhere upon the surface of it within its surface lines or anywhere below the surface within those lines extended down vertically; and though it should be shown that the work done within the lines below the surface was also within a lode having its apex outside of such vertical surface lines, it will still be work on the claim within the meaning of Section 2324 of the U. S. Revised Statutes.

The notice of location need not necessarily be placed on ore, or on any part of the vein or lode; but it is sufficient if placed in sufficient proximity and relation to the ledge as in connection with the work done under it, to give notice to all comers what ledge is intended.

If one takes up a claim as the agent of another, the title vests in the other and the agent, by his mere act, cannot subsequently divest it.

There is no law to prevent a person from relocating his own mining claim by a different name; and if he does so and then conveys it by the latter name, there is no reason why the existence of the former location should invalidate the deed.

If several persons locate a claim and by a failure to comply with law forfeit it, it may be relocated by a part of the first locators, along with others who were strangers to the first locations; and those whose names are left out of the notice of relocation cease to have any interest in the mine.

The relocation of an abandoned claim by a prospector, outfitted by another under an arrangement to share equally in all discoveries amounts to the same thing as if the prospector had located a new discovery.

When one or more parties firet locating mining gronnd afterwards made a second location on the same lode, with the names of other parties added to the notice of location, it appearing at the time of the sscond location the ground was undeveloped, and it was not known that both notices were on the same lodc; and it further appearing that the second notice was posted for the express purpose of protecting the original location, a Nevada court hsld that the second location did not of itself constitute an abandonment of the first location.

When the first claimant who takes up a claim is not a citizen, or has forfeited hie right by noncompliance with the mining laws, or abandoned his claim, the mining groond staked off by him is open to location hy any U. S. citizen.

Posting a notice on a tree at each end of a claim, or sticking up a pile of rocks in the middle of the claim, is not sufficient compliance with the law, whicb requiree a location or relocation to be "distinotly marked on the ground so that its boondariee can be readily tracsd." Any marking by etakes, moonds and notices will do, hut tbey must be such that the *boundaries* may be traced.

Where a party applies for a patent on a relocated mine bo must prove that the reqnired $500 has been spent on the mine by himself or grantors; and the fact that tbe original owners, who afterward abandoned it, spent that amount, does not relieve the rslocator of the responeihility of doing that much work.

Alisns cannot hold a mining claim prior to iseoance of the patent. An aeeignor can tranefer no greater intereet than he has, and the purcheser from an alien of an unpatented mine acquiree no title thereto. Such purchaser, however, may relocate the claim and thereby acquire a poeeessory title on complying with local and general laws.

The Act of Congress of January 22, 1880 (referring to expenditures) doee not annul the provisione of the State (Colorado) law, which requires a diecovery shaft to be sunk within a certain number of daye from date of discovery.

It will be remembered that the United States lawe provide that "miners of each district may mske regulatione not in conflict with the lawe of the United Statee," etc. In the same section it ie provided as one of the requirements that *not less* than certain amounts named sball be annually expended on lode claims. It follows that the State, territory or district laws may require *more* then the amount named in the United States law, it cannot make a less requirement, becenee it would be in conflict with the lawe of the United Statee, which name the least sum which will preclude relocation.

The Commissioner of the General Laud Office, in a written opinion of Oct. 21, 1881, eaid: "The local lawe may require expenditures to he made in a certain manoer end within certain periods not named in the U. S. Law."

The man who contributes his proportion of the *required* expenditures can retain his interest in the mine. If he fails to contribnte his proportion of the *actual* expenditnree the remedy must he sought in the courts, not in the Land Office.

Where a party abandone a mining claim, be has the undoubted right to remove from said claim any machinery or buildings he may have placed thereon, or auy ore he may have extracted from the mine. The ore in tbe dump ie, therefore, the original owners.

A party relocating an abandoned mine may either eink new shafte and run new tunnels, or continue the work upon snch ehafts or tunnels as may have been constructed by parties who had ahandoned the same.

While bolding possession for the purpose of making tbe development reqoired hy law, the locator's rigbt to the lode ie complete and it cannot be conveyed except by deed. It may neverthelese be loet hy abandonment, or by volunterily yielding the poseession to another whicb ie the same thing. And eo if the locator admits another to the poeession witb him, this will amount to an ahandonment *pro tanto*, and a retaking by tbe party admitted, upon which they will become interested in the lode jointly, or otherwiee, according to their agreement. In these particulare the rule ie the eame when applied to the relocation of an abendoned claim.

Minere mnet not only comply to Government laws but alao to locel regulatione of the dietricte where theee ledgee are located.

Where a rule or custom of minere in force, requiree a location to he recorded euch recording is necessary, otherwise not; but it is best to he on the safe eide and record any how.

The removal of a locator'e notice, marks, etc., hy othere doee not divest bim of his rights.

If the local mining laws of a district provide that, ou a failure to work and notice a claim as required hy the mining laws, the claim shall be coneidered ae abandoned. A failure to comply with such lawe is an abandonment of tbe claim, and it is opsn to location as vacant ground.

Tbe failure to perform the amount of work on a mining claim required hy the local mining lawe or regulatione etabliehed and in force in the district, amounts to an ahandonment of the claim, and thereupon it mey he occupied and appropriated by another.

If the poeeession of the occupant be continued in another, hy the expression of a wish or deeire of the occupant to another that he succeed to the poseession, and he thereupon takes poesession, a gift is the result; there is *no* vacancy in the possesaion, and conequently no abandonment.

Miners will remember tbat claims located eince May 10, 1872, reqnire $100 of work each calendar year, and mines located prior to tbat date require $10 wortb of work for each 100 ft. on the claim.

With regard to the qusstion of locating claims on *Sunday*, we have something to say in another column of this number.

In the next nomber of the PRESS we will give our mining friends some points on miniog partnership, and show ehow them how to get rid of non-paying partners.

Deep Mining.

The Problem as it ie Being Worked on the Comstock.

[Written for the PRESS by JAMES DELAVAN.]

The workings of the minee of tbe Comstock have been carried to great depths, reaching from 2,000 to 3,000 ft., and the resnlt has not bssu very satiefactory below the 1600 levels. It is true that the Union Con. had ore from the 2100 level to the 2400, but in the otber mines no coneiderable nmount of high-grade ore has been developed below the 1600 level. It woold eeem that it is useless to go to any depth below that with the expectation of finding bonanza ore. In tbe lower levele already reached the eame vein matsrial continues to be found se was found above, and eome qoartz, which is barren, or so nearly eo, that it will not pay the expenee of mining and milling it. Thus far, it hes become a eettled fact that it ie useleee to penetrate the earth to so great depths as bes heen doue in the Comstock mines with the expectation of finding ore in sufficient quantity and quality to make it remunerative. That fact hes been demonstrated. As to why it is so, there are different theoriee. One is that the rocke and water are eo mucb heated that what mineral there is, is beld in eolution and cannot crystallize and become solidified. Therefore, at any point below the 1600 or 2000 level the heat is so intense that it is impoeeible for the preciouo metale to become of sufficient deneity to combine with the matrix, and therefore ore need not be expected to be found there.

It has been hoped that the water in the earth would be found at a certain depth, to have changed from a high temperatore to a much lower one, and that these bodies of ore would be found as they were in the uppar levels; but thus far that has not been the case, and I am of the opinion that it will never bs.

The workings on the Comstock and experience in the mines may serve as a guide to miners in other localitiee, ae when it will be necessary to ceaee psnetrating the earth in search of the precious metale; and, therefore, a great amount of expensive work would be saved where there was no hope of adequate returns. Some of our so-called mines, worked to a depth of 2,500 and 2,800 ft., although large amounte of qnartz rock have been found in them, are almost barren of tbe precious metale. Most of them have had good ore at and near the surface, and to a depth of 1,000 and 1,600 ft. If bodies of high grade or bonanza ore are found on the 2600 level and down to the 3,000, then it may be said that the theory as to the beat preventing the crystalization of the metels and being held in eolution is incorrect. That fact will be demonstrated, as I suppose that work will be contioued, until the 3,000 level has been attained. The Yellow Jacket mine reeched the 3,000 level some time eince, and the company hae had many drifts and crosscuts run in different directions on the 2828 and 3000 levels, hut have developed no ore, although some quartz bes been encountered containing a small amount of tbe precious metale. Enough has been done on those levels to convince anyone that no paying bodiee of ore are likely to bo found at tbose depthe.

The Utah mine is now down to the 2500 level, and no ore has heen developed in any portion of the mine. Crosscuts and drifts have been run from the vertical shaft and inclines. A cross drift ie now heiog rnn eaet from the bottom of the incline (2500 level), and no ore hae as yet heen found. The Sierra Nevada hae no developed ore of any value on the 2500 level, although a large amount of exploitation bas been done. The joint Sierra Nevada and Union Con. winze ie down to the 2800 level, and but little ore hes heen found. It ie boped that the Union Con. may develop ore on the 2700 level; but I think the chancee are that it will not be found that will pay the expense of extracting and milling. The Ophir and Mexican have a joint winze that hae heen sunk from tbe 2500 level to the 2910 level, and a cross-drift has been run east from tbe 2900 level of the winze several hundred ft., and no ore hae been encountered, although a large amount of promiseing vein material has been passed through. The California and Con. Virginia have gone at eome depth below tbe 2500 level, and have made no development of ore. The Best & Belcher and Gould & Curry have extended their exploration to a depth of 2118 ft. and have not eucceeded in finding ore. As yet the Savage, Hale & Norcroes, Chollar and Potosi have found no ore on the 2400 level, although there hae bsen no search for it, beyond runuing a drift from the combination shaft (a drain shaft for those mines). What little ore the above mines have had helow the 1000 level has been of low grade. The Julia and Bullion that bave heen eonk on to the depth of about 2500 ft., have bad no ore in any of their levels from the snrface. The Crown Point and Belcher have carried their workings down to the 3000 level, and no ore of velne has been developed. The Belcher company still hold ont the idea that they will have ore on the 2800 and 3000 levels, bnt I am of the opinion that they will not, except it may be small stringers that will not amount to much.

From the experience in the Comstock mines, I am forced to believe that it is useless to go below a depth of 1600 ft to look for bodies of paying ore. Tbat being the case, would it not be more reasonable to csase working to so great depth as has been attained, and turn the attention of capitaliete to developing new minss, wbich coold be done at much less expense and with a more certain prospect of an adequate return from them. There is a large amount of promising ground in tbis section of the country for the development of mines, that with comparatively a small amount of money expended upon them. The Regent mine, in Silver City, ie a sample of what may be expected from opening new minee. They have taken out a large amount of ore that has paid all expenses, and returned a good profit, and only from a depth of 140 ft. and above that. Since the 200 level has been reached, the quality of the ore hee been much better than that taken out above. West of the old Ophir croppings, a man by the name of Rowe, made a discovery of a rich vein of ore not far below the surface. When the Ophir company found it out, they claimed it and attached the ore he had out, and brought suit for damage, for tbe emount that he had realized from ore that he had milled. The man Rowe became frightened and took a certain amoont of money to abandon the ground, giving it up to the Ophir company. To the publ c it makes no difference ae to whom the gtoond where thie discovery was made belongs to. But the Iowa company, whose mining ground wae located west of the Comstock claim, that the discovery is on their ground, and I think are prepared to show it. They have run a drift eouth from their shaft on the 200 level that will bring them directly under the point of the discovery, and where the Ophir company are taking out ore. In the preliminary survey of the Ophir, preparatory to making an application for a patent, the west boundary line was fixed about 600 feet west of the west wall of Cometcck, whereas it ehould have been the west wall of the Comstock instead. The Iowa company protested against a patent being issued according to their eurvey. The Commissioner of the General Land Office at Washington refosed to consider the protest, on the ground that it was not filed within the time prescribed by law, notwithetanding the Ophir Company'e application *specifically* set forth that it claimed only such eurface ground as lay within the walls of the Comstock, and that the Iowa company, relying upon the supposition that the Government would not grant anything more than was asked for, when hy so doing it would clond the title of another claimant to mining ground west of the Comstock, and knowing that the gronnd as originally claimed and applied for did not conflict with the Iowa company'e mining claim, which was tbe reason why the Iowa company did not file its protest within the 90 days then allowed by law after the filing of the Ophir application. But upon the solving of the mystery ae to the locality of the west wall of the Comstock by this final snrvey of the Opbir company, it was too late for the Iowa company to assert its rigbts to ite property, upon which it had expended a large amount of money, notwitbstaoding the fact that the Ophir claim, as applied for in ite application, did not conflict with the Iowa company'e ground, and the furtbsr fact, that within 30 days after the final survey had virtually located the west wall of the Comstock 600 ft. west of its true position, and the Iowa company was then for the first time mede aware of the fact that tbe Ophir company wanted to extend its west line 600 ft. farther west than it had asked in ite application, the Iowa company *had filed its protest*. An appeal was taken hy tbe Iowa company from this decision of the Commisaioner to the Secretary of tbe Interior, who held that the Ophir mining company was only entitled to the ground asked for in its application for a patent, and tbereupon ordered thet a patent be issued for the ground claimsd by said company, but that a reeervation clause be inserted therein to the effect that no ground lying west of the west wall of the Comstock was intended to he conveyed by eaid patent. The Iowa company have ascertained the fact by actual development, that the west wall of the Cometock ledge lies about 600 ft. east of west line of tbe Ophir company's final survey, and about 300 ft. east of the Rowe development. The Iowa company have set up a claim to the ground, and notified the Ophir company to desist from treepassing thereon, preperatory to bringing a suit for posseeeion and damages. The Iowa company seem to have a valid claim to that ground and should hold it.

EVERY miner ought to he in possession of the MINING AND SCIENTIFIC PRESS of the 17th. That number of the PRESS is twice its usual size, and contains much important information which should be read hy every miner. Send 10 cents in stamps to Dewey & Co. for a copy. You will never regret it.—*Georgetown Gazette.*

ONE difference between mining on tbe Comstock and mining in Arizona is that on tbe Cemetock to strike water is a calamity, and in the latter it ie considered equal to etriking a big body of ore. Water commands a price in Arizona.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING DECEMBER 20, 1881.

251,013.—HAY UNLOADING AND STACKING APPARATUS—Jos. C. Austin, Imusdale, Cal.
251,021.—GAS RUNNER—Wm. M. Blaine, Salinas, Cal.
251,337.—DESK—J. H. Burrows, Boise City, I. T.
251,023.—TRANSOM ADJUSTER—B. H. Carter, Oakland.
251,201—WASHING MACHINE—M. J. Fenwick, Cottage Grove, Or.
251,034—FOOTSTOOL FOR ROCKING CHAIRS—Ferdinand Franz, S. F.
251,044—ORE CRUSHER AND GRINDER—Wm. Gutenberger, Sacramento, Cal.
251,114—WIRE ROPE AND CABLE—A. S. Halldie, S. F.
251,045—ATTACHMENT FOR CLEANING-SHOES OF THRASHING MACHINES—H. Hamilton, Visalia, Cal.
251,115—BUCKBOARD WAGON—J. Hansel, Stockton, Cal.
251,054—PAINT COMPOUND FOR METALLIC SURFACES—Eugene Jones, Gold Hill, Nev.
251,119—FIELD THRASHER—H. Jory, Marysville, Cal.
9,985 (re-issue)—ARTIFICIAL TOOTH—C. H. Mack, Walla Walla, W. T.
251,264—STAMP MILL—Jas. F. Marvin, Ft. McDowell, A. T.
251,127—PICTURE FENDING DEVICE FOR MAGIC LANTERNS E. J. Muybridge, S. F.
251,237—PLOW—C. H. Remington, Gilroy, Cal.
251,060—PIANO STOOL—S. W. Shaw, S. F.
251,070—SASH FASTENER—S. W. Shaw, S. F.
251,302—HYDRAULIC MOTOR—W. J. Silver, Salt Lake City, Utah.
251,076—FAUCET—M. Tommasi, Smith's Ranch, Cal.
251,145—EXPLOSIVE COMPOUND—G. von Planitz, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'e SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of especial mention:

WIRE ROPE AND CABLE.—A. S. Hallidie, S. F. Dated Dec. 20, 1881. No. 251,114. Mr. Hallidie's invention refers to tbe wire ropes need in hoisting, haulage, transmitting power, and for similar purposes. The ordinary method of making wire ropes ie to twiet or lay together cylindrical wiree of the same metal into strands, or to lay or twist theee etrands together to form a rope. Ropea made in this manner, when eubjscted to considerable friction or pressure, have the exterior wires compoeing them very much flattened and worn upon their outer eurfaces, and on account of thie wear the strands break, and the rope becomes stranded. Mr. Hallidie propoees to lay the straude of the rope in euch a manner that tbeir exterior sorface shall approximate in form the curve of the circumference of the rope, thus producing a more eolid and compact rope, with a eurface less sueceptible to wear, and presenting less irregularities to be acted upon. Mr. Hallidie has also applied for a patent for a machine for flattening the wires.

HAY UNLOADING AND STACKING APPARATUS. Joseph C. Austin, Imuedale, Monterey Co., Cal. Dated Dec. 20, 1880. No. 251,018. Thie invention relates to certain improvments in that clase of apparatns by which hay or similar substancee may be removed from a wagon to a barn or etack. It consists in certain detaile of conetruction hy which loads of hey may be removed from the wagon, carried the whole leogth of the harn and forcibly deposited at the oppoeite end of tbe barn from tbe wagon at a single operation. Eacb euccessive load ie transferred to the top of the precsding one, until the end of the barn is foll. The next section is then filled in the eame manner and eo on in succession nntil tbe whole barn bes been filled from the eingle entrance at one end.

PAINT COMPOUND FOR METALLIC SURFACES. —Eugene Jones, Gold Hill, Nev. Dated Dec. 20, 1881. No. 251,054. This invention relatse to a compound which is used for covering wire ropes, euch as are employed for mining purposs, rigging of shipe, cahle railroade and in other placee. It can also be put on ships' bottome, water pipee and other metallic surfaces. The object of the compound is to prevent corroding or crystallizing of the article on which it is placed, either when need under water or exposed to the atmosphere. It will he specially useful in cables in the shafte of wet minss.

ATTACHMENT FOR CLEANING SHOES OF THRASHING MACHINES.—Hugh Hamilton, Visalia. Datsd Dec. 20, 1881. No. 251,045. This invention relates to that claee of agricultural implements known ae thrashing machines, and more especially to certain improvemente thereon, conesting of an attachment for the cleaning ehoes to prevent the riddles being choked up with straw.

EXPLOSIVE COMPOUND.—Guetav von Planitz, S. F. Dated Dec. 20, 1881. No. 251,145. This ie a novel compound as a base for blasting and other powdere, and relates also to a procese for preparing the seme. It coneiete in combining nitric acid with reein under peculiar circumetances, which cauese a decomposition and the formation of an entirely new acid compound,

PACIFIC MACHINERY DEPOT.

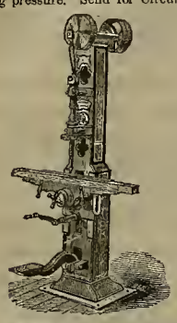
The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

H. P. GREGORY & CO.,

Importers and Dealers in Machinery and Supplies.

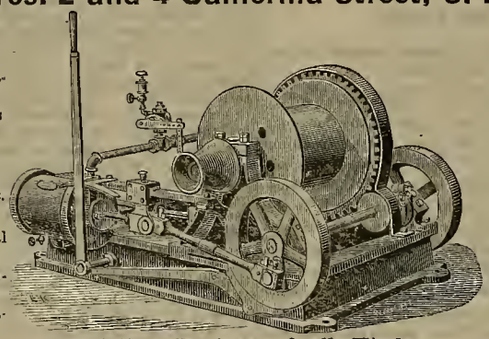
Nos. 2 and 4 California Street, S. F.

BLAKE STEAM PUMP.
More Than 16,000 in Use.



SOLE AGENTS FOR.

Fay & Co., Wood Working Machinery.
Bement & Son's Machinists Tools.
Blake's Steam Pumps.
Perry's Centrifugal Pumps.
Gould's Hand & Power Pumps.
Perrin's Band Saw Blades.
Payne's Vertical and Horizontal Steam Engines.
Williamson Bros. Hoisting Engines.
New Haven Machine Co.'s Machinists' Tools.
Otto Silent Gas Engines.



Hoisting Engines of all Kinds.

SOLE AGENTS FOR.

Sturtevant's Blowers and Exhausts.
Judson's Steam Governors.
Pickering's Steam Governors.
Tanite Co. Emery Wheels.
Nathan & Dreyfus' Oilers.
Korting's Injectors and Ejectors.
Disston's Circular Saws.
New York Belting & Packing Co.'s Rubber Belting, Hose, Packing, etc.
Ballard's Oak Tanned Leather Belting.

6 California Street,

—o—

WIRE ROPES AND CABLES,

Manufactured at my works, guaranteed to be equal in quality to any made, and as cheap, for

MINING AND SHIPPING PURPOSES, ETC.

Wire Suspension Bridges and Aqueducts.

WIRE TRAMWAYS — WIRE ROPE — FLAT AND ROUND WIRE — GALVANIZED & PLAIN — CABLE RAILWAYS

A. S. HALLIDIE,

San Francisco, Cal.

—o—

WIRE OF ALL KINDS,

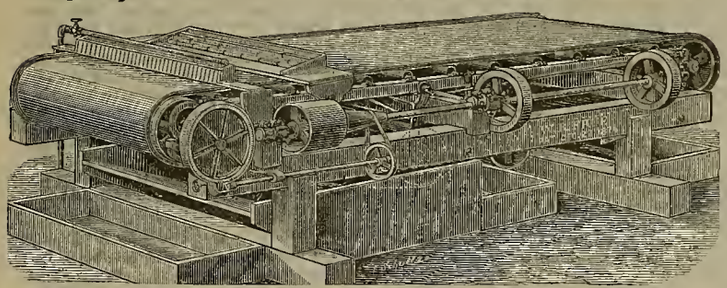
Manufactured at my Wire Mills in this city, superior to any imported, for

Telegraph, Bailing and Fencing, etc.

WIRE STAPLES AND WIRE NAILS.

Wholesale and for Export.

$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

MUSICAL BOXES.

M. J. PAILLARD & CO.,

Manufacturers and Importers of all Kinds of

MUSICAL BOXES

Of Standard Reputation. The largest and finest assortment in the city. Musical Boxes with changeable cylinders always on hand at low figures. The latest style patented, "THE INTERCHANGEABLE," patented February 11, 1879.

Repairing Musical Boxes and Furnishing Material a Specially.

23 DUPONT STREET, SAN FRANCISCO.

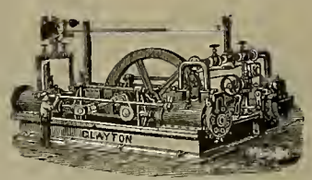
A. E. JUILLERAT, Sole Agent for Pacific Coast. (Branch House of 680 Broadway, N. Y

CLAYTON AIR COMPRESSORS,

—AND—

INGERSOLL ROCK DRILLS.

INGERSOLL ROCK DRILL.



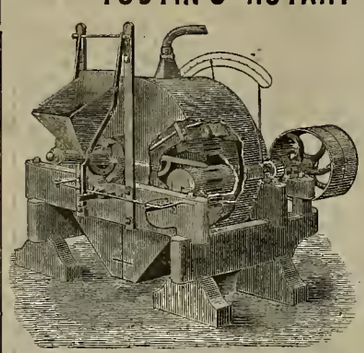
CLAYTON AIR COMPRESSOR.

Having been appointed Sole Agent for this Compressor, I will keep a full stock of the different sizes in store. Prices much less than any First-class Compressor in the market. ☞SEND FOR CATALOGUE.☜

GEORGE R. FOARD, 18 First Street, S. F.

Sole Agent for the Ingersoll Rock Drill and Clayton Compressor Co.

TUSTIN'S ROTARY PULVERIZING MILL.



WORKS ORE WET OR DRY,

And Feeds Itself Automatically.

Patented October 11, 1881.

One of these machines can be seen at the Ore Sampling and Pulverizing works of Hofmann Bros., No 415 Mission St., where it is working every day. Weight 5,000 lbs., heaviest piece 480 lbs.

Manufactured at the

TUSTIN WINDMILL, HORSE POWER AND PUMPING MACHINE WORKS.

308 Mission Street, S. F., Cal.,

By W. I. TUSTIN, Inventor and Patentee.

Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON.

☞Orders Solicited and Promptly Executed.

Office, No. 202 Market St., UNION BLOCK.

Metallurgy and Ores.

WM. D JOHNSTON,
(Formerly Chief Assayer with Thos. Price.)
ASSAYER AND ANALYTICAL CHEMIST,

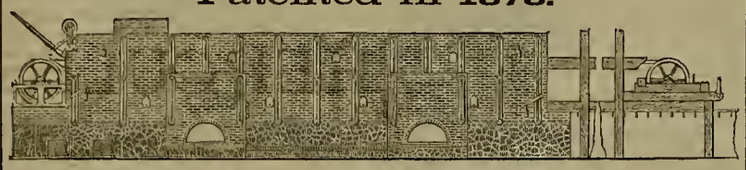
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

THE O'HARRA
CHLORIDIZING FURNACE.
Patented in 1878.



SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.
BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.
A cheap Furnace to build and to run.
The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.
At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.
At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61¼.
Lewis Chalmers, of the Isabella O. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures thoro given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.

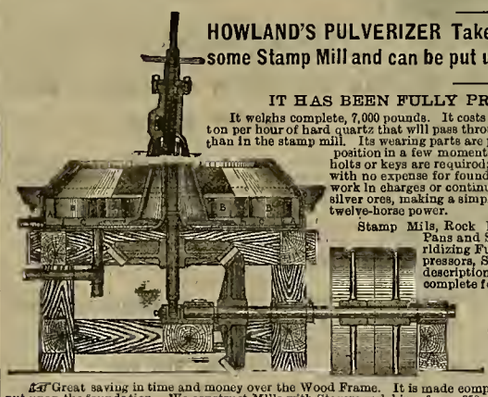
MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

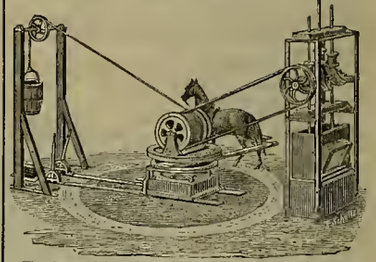
New Mining Horse Power.



The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.
This power is light and strong, so that two or more horses can be used for crushing ore or other work.

The Spring Valley Hydraulic Gold Mine.

[CONTINUED FROM PAGE 441.]

a veritable river 400 ft. wide and several feet deep. The water sheds which is drained by this canal, aggregates several hundred square miles.

At times of great floods it may he true that damage to lands and crops has occurred hy the breakage of the levees, but it should he borne in mind that the quantity of water which flows into the canal from the mine is not more than one 50th part of the water which finds its way into the canal during heavy storms. The company has expended hundreds of thonsands of dollars to prevent damage hy debris and must continue to expend large sums to maintain its levees.

It is thought hy some that the original plan should have been to have kept the mining water entirely separate from the natural drainage water of the country. Had such a system been adopted, it would have been much cheaper for the company and no damage hy floods could have been charged against it, but on the contrary low and sterile lands could have been made to produce abundant crops. At the present time parties owning low land contiguous to the canal are making arrangements to have it covered with slickens in order that it may become more productive. Thns the same deposit which the farmers in certain parts of the State are trying to prevent the miners from sending down upon their lands, claiming that it destroys all vegetation, is being sought after in this locality as the only material which will make the lands arable. The future prospects of the mine are very promising indeed. As soon as the tunnel is completed and the flumes put in, it is expected that the yield of gold will far exceed that of former years, and will he double the present output. Judging from the quantity and quality of gravel, and taking into consideration the splendid facilities for the future working of the mine, there is little doubt but that the hopes of the most enthusiastic of the owners are about to he realized, and that this mine will in the future he classed not only among the largest producing mines, but will he the best paying hydraulic mine in California.

News in Brief.

SMALLPOX is reported spreading in New Jersey.

TRAVEL is unusually light at present on the Virginia and Truckee railroad.

GREAT BRITAIN is said to have lost $1,000,000 in the last three years in crops.

THE San Jose fruit cannery employes 400 hands in the season, and puts up 2,000,000 lbs. of fruit.

ONE thousand men are wanted in the Yellowstone valley, M. T., for railroad work—wages $2 per day.

THE yield of potatoes of all kinds last year in Ireland amounted to 3.6 tons per acre, against 1.3 tons in the previous year.

NEWS from Magdalena, Mexico, is to the effect that work has been resumed on the Guaymas road, via the Magdalena route.

TRAVELERS report that in Africa there are falls on the Zambezi river 500 ft. high, or more than three times the hight of Niagara.

WITHIN the next twenty months Yavapai, A. T., expects 150 miles of railroad crossing that county, running from east to west.

THE noted Mullan Pass Tunnel, M. T., is to he 16 ft. wide, 20 ft. high, and 3,800 ft. long (about ¾ of a mile) through solid granite.

THE A. T. and S. F. surveyors are now running their lines from Tucson up the Santa Cruz to Calabesas, the end of the Benson and Calabesas road.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is repleto and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry O. Hanks, State Mineralogist.

REMITTANCES to this office should be made by postal order or registered letter, when practicable; cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half-ounce), 10 cts.

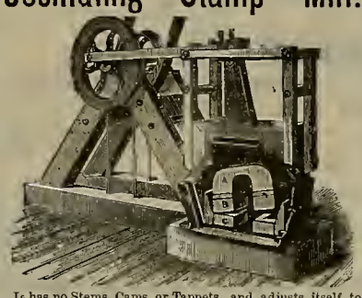
HUNTINGTON'S Oscillating Stamp Mill.



It has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by
F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,
220 Fremont Street, San Francisco, Cal.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half-year ending December 31st, 1881, the Board of Directors of THE GERMAN SAVINGS AND LOAN SOCIETY has declared a dividend on Term Deposits at the rate of Five (5) per cent. per annum, and on Ordinary Deposits at the rate of four and one-sixth (4 1-6) per cent. per annum, free from Federal Taxes, and payable on and after the 9th day of January, 1882. By order,

Persons in the country ordering to the amount of $12, I pay the express charges. I sell nothing but my own manufacture.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade

GRANITE BLASTING POWDER?

If you have not, give it a trial and you will be satisfied that it will do more work for less money than any Powder in the market, and refer to numerous testimonials in support thereof to be found at our office.

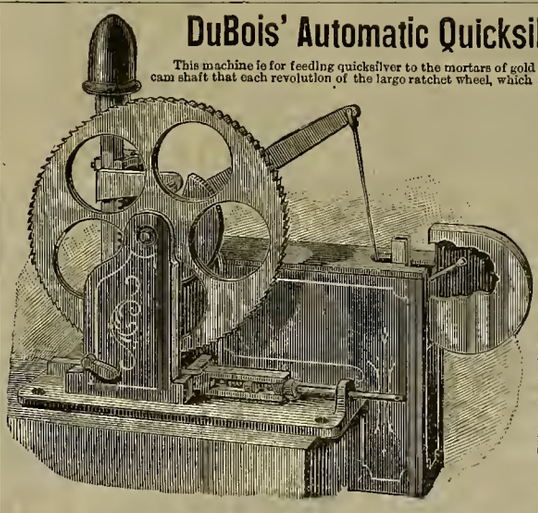
Put up in kegs of 25 lbs., either glazed or not, to suit customers.

GIVE US A TRIAL.

R. D. HUME & CO., Gen'l Agents,

No. 405 Front street, Rooms 1 and 2, San Francisco, Cal.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.

Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

The CONSUMER'S COMPANY sell the best Powder at the lowest rates.

Office—218 California St., San Francisco.

Tubbs Hotel,

OAKLAND, CALIFORNIA.

An elegant family residence in charming grounds. Two hundred rooms. Near steam and street cars. Forty minutes to or from San Francisco. Trains every half hour. Five-cent fare. Table d'Hote or Restaurant. Splendid suites of sunny apartments or single rooms with or without bathrooms. The most HEALTHY and agreeable location on the Pacific Coast. Mean yearly temperature 55°. Sun unobscured from March to November. A HOME for tourist or invalid. Good cuisine under a celebrated Chef. Prices more reasonable than any hotel of its character in California. Livery stable, laundry, billiard room, telegraphic communication, etc., in connection with the hotel. Special terms made. All applications answered.

109 & 111 Beals St., S. F.

Upright and Horizontal
Engines & Boilers.
SPECIALTIES:
Upright Engines from 4 to 15 horse-power. Also, Portable and Stationary Engines.

Golden State & Miners Iron Works,
Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.
STEVENSON'S PATENT
Mold-Board AMALGAMATORS,
Golden State Pressure Blowers.
First St., between Howard & Folsom, S. F.

California Brass Foundry,
No. 125 First Street, Opposite Minna.
SAN FRANCISCO, CAL.
All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.
J. H. WEED. V. KINGWELL.

California Machine Works,
WM. H. BIRCH, Prop'r.
119 Beals Street, San Francisco.
General Mechanical Engineer and Machinist. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturer of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Agent and Manufacturer of F. A. Youse's Patent Steam Packing Rings for Steam Pistons. The best ever invented; can be applied to any Engine Piston and give entire satisfaction to those using. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

STEAM ENGINES AND BOILERS
Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by
J. HENDY, 49 and 51 Fremont Street, S. F.

THOMAS THOMPSON. THORNTON THOMPSON.
THOMPSON BROTHERS,
EUREKA FOUNDRY,
and 131 Beale St., between Mission and Howard, S. F.
MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

LUTHER WAGONER. JNO. H. HAMMOND.
WAGONER & HAMMOND,
MINING ENGINEERS,
No. 318 Pine St., S. F.

E. BUETTNER, C. E.
Mining Engineer.
MINING PROPERTIES EXAMINED AND REPORTED ON
FRISCO, BEAVER COUNTY, UTAH.

Send for New Illustrated Catalogue.
CLAYTON AIR COMPRESSORS,
With Price List, issued Sept. 1, 1881.
CLAYTON STEAM PUMP WORKS,
14 and 16 Water Street, Brooklyn, N. Y.

M. C. IHLSENG, E. M., Ph. D.
Civil and Mining Engineer.
Formerly of Columbia College School of Mines, now of State School of Mines, will examine, survey and report on poperty or methods. Box 409 Golden, Col.

COKE. PATENT. COKE.

This COKE is exclusively used by Prof. Thomas Price, in his assay office, by the Selby Smelting and Lead Co., Prescott, Scott & Co, Risdon Iron and Locomotive Works and others in this city. Large supplies are regularly forwarded to consumers in Salt Lake and Nevada, to the Copper Queen Mining Co., Longfellow Copper Mining Co. and other consumers in Arizona.

The undersigned are in receipt of regular supplies from Cardiff, Wales, and offer the COKE for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

GEORGE W. PRESCOTT. IRVING M. SCOTT. H. T. SCOTT.

Pacific Iron Works.

Established in 1850.
RANKIN, BRAYTON & CO.
Office—127 First Street, San Francisco, Cal.
Builders of Engines, Boilers, all Classes of Machinery.
PLANTS FOR GOLD AND SILVER MILLS,
Embracing the latest and most Improved Machinery and Processes for Base and Free Ores.
WATER JACKET SMELTING FURNACES,
For both Galena and Copper Ores of the Most Improved Construction.
Having Built nearly every successful working Furnace on the Coast, we are prepared to guarantee the best results attainable in all classes of Ores.
HOISTING AND PUMPING MACHINERY,
Embracing all Known Improvements.
WHEELOCK'S AUTOMATIC CUT-OFF ENGINE,
Beyond Question the most economical and perfect working Engine now made.
WALKER'S COMPOUND STEAM PUMPS,
The best in use. W work with thirty per cent. less steam than any other Pump in the market.
Sole Agents for HOWELL'S IMPROVED WHITE FURNACE.
The only successful Chloridizing Furnace made. Over fifty of them in use on this Coast.
Parties Wanting any kind of Mining Machinery are requested to send for Illustrated Circular.

William Hawkins,

(SUCCESSOR TO HAWKINS & CANTRELL).
MACHINE WORKS,
210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.
Manufacturer of
IMPROVED PORTABLE HOISTING ENGINES,
FOR MINING AND OTHER PURPOSES.
Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouses and Public Buildings.
Steam Engines and all Kinds of Mill and Mining Machinery.

L. C. MARSHUTZ. T. G. CANTRELL.
National Iron Works.

Northwest Cor. Main and Howard Sts., San Francisco.
MANUFACTURERS OF
IMPROVED PORTABLE HOISTING ENGINES.
Stationary and Compound Engines, Quartz Crushing and Amalgamating Machines, Flour, Sugar and Saw Mills
SOLE MANUFACTURERS OF
Kendall's Patent Quartz Mill, National Ore Feeder & Concentrator.
CASTINGS AND FORGINGS OF EVERY DESCRIPTION.

GOLD MINERS

WORKING PLACER, GRAVEL AND QUARTZ MINES,
SAVE YOUR GOLD!
—BY USING—
SILVER PLATED AMALGAMATING PLATES.
The most economical and successful process now in use. Will warrant my Plates to save a very much larger percentage of gold than any other method.
SWING AND RIFFLE PLATES for Saving Float Gold Made to Order.
OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.
ALL KINDS OF METAL GOODS PLATED!
San Francisco Gold, Silver and Nickel Plating Works,
653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.
Send for Circular. EDWARD G. DENNISTON, PROPRIETOR.
Awarded First Premium at Every Fair of the Mechanics' Institute for the Last Twelve Years.

THE RISDON IRON AND Locomotive Works.

Corner Beale and Howard Sts.,
SAN FRANCISCO, CAL.
W. H. TAYLOR, Pres't. JOSEPH MOORE, Sup't
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

DODGE ROCK BREAKER

Challenges the World

To produce as good and cheap a Machine. Rock Breaker and Cornish Rolls combined in one Machine. Pulverizers, to Granulate Ores, for Roasting, Chloridizing, Leaching and Concentrating.

Concentrating Machinery!

FOR CONCENTRATING
Gold, Silver, Lead and Copper Ores.

Furnaces for Roasting and Chloridizing Ores, for Amalgamation or Leaching.
Plans, Drawings and Estimates for Working Ores by any process.
M. B. DODGE,
143 Fremont St., - - San Francisco

San Francisco Pioneer Screen Works
J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT OUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.
32 Fremont Street, San Francisco.

Diamond Drill Co.
The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.
A. J. SEVERANCE & CO.
Office, No. 320 Sansome street, Room 53.
